

# Agilent E5072A ENA Series Network Analyzer

30 kHz to 4.5/8.5 GHz

## Data Sheet

**Agilent Technologies**

## Options

This document provides technical specifications for the E5072A ENA network analyzer.

E5072A-245	2-port with configurable test set, 30 kHz to 4.5 GHz
E5072A-285	2-port with configurable test set, 30 kHz to 8.5 GHz

## Calibration kits and ECal modules

This E5072A data sheet provides technical specifications for the following calibration kits and ECal modules. For models not listed in this data sheet, please download the free Uncertainty Calculator from [www.agilent.com/find/na\\_calculator](http://www.agilent.com/find/na_calculator) to generate the curves for your calibration kit.

85092C	Electronic calibration (ECal) module
85093C	Electronic calibration (ECal) module

## Definitions

### Specification (spec.):

Warranted performance. All specifications apply at 23 °C ( $\pm 5$  °C), unless otherwise stated, and 90 minutes after the instrument has been turned on. Specifications include guard bands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

### Typical (typ.):

Describes performance that will be met by a minimum of 80% of all products. It is not guaranteed by the product warranty.

### Supplemental performance data (SPD):

Supplemental performance data represents the value of a parameter that is most likely to occur; the expected mean or average. It is not guaranteed by the product warranty.

### General characteristics:

A general, descriptive term that does not imply a level of performance.

## Boundary Conditions

In this data sheet, boundary conditions are given for the specifications. For example, system dynamic range is 98 dB with the following boundary conditions.

**Frequency: 10 MHz, IF bandwidth: 3 kHz**

If the same boundary conditions fall under more than one category in a table, apply the best value.

## Corrected System Performance

The specifications in this section apply to measurements made with the Agilent E5072A network analyzer under the following conditions:

- No averaging applied to data
- Environmental temperature of 23 °C ( $\pm 5$  °C) with less than 1 °C deviation from the calibration temperature
- Response and isolation calibration performed

Description	Specification	SPD
<b>System dynamic range at test port <sup>1</sup></b>		
(IF Bandwidth = 3 kHz)		
30 to 300 kHz	65 dB (Typ.)	
300 kHz to 10 MHz	82 dB	
10 MHz to 6 GHz	98 dB	
6 to 8.5 GHz	92 dB	
(IF Bandwidth = 10 Hz)		
30 to 300 kHz	90 dB (Typ.)	100 dB
300 kHz to 10 MHz	107 dB	115 dB
10 MHz to 6 GHz	123 dB	130 dB
6 to 8.5 GHz	117 dB	128 dB
<b>Extended dynamic range at direct receiver access input <sup>2</sup></b>		
(IF Bandwidth = 10 Hz)		
30 to 300 kHz		128 dB
300 kHz to 10 MHz		134 dB
10 MHz to 3 GHz		151 dB
3 GHz to 6 GHz		147 dB
6 to 8.5 GHz		145 dB

1. The test port dynamic range is calculated as the difference between the test port rms noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainty and interfering signals into account.

2. The direct receiver access input system dynamic range is calculated as the difference between the direct receiver access input noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account.

### Test port output signal purity

Description	Specification	Typical
<b>Harmonics (2nd or 3rd)</b> (at 5 dBm)		
30 kHz to 2 GHz		< –25 dBc
2 to 8.5 GHz		< –20 dBc
<b>Non-harmonic spurious</b> (at 5 dBm)		< –30 dBc

1. Power calibration using an external power meter improves level accuracy of the test port output power.
2. Level accuracy of other frequency is taken at 0 dBm, relative to 50 MHz reference unless otherwise stated.
3. Level linearity given is relative to 0 dBm.
4. Stop power may be limited by maximum power.

## Group Delay <sup>1</sup>

Description	Specification (dB)	Supplemental information
Aperture (selectable)	(frequency span)/(number of points - 1)	
Maximum aperture	25% of frequency span	
Minimum delay		Limited to measuring no more than 180° of phase change within the minimum aperture.
Accuracy		See graph below (Typical)

The following graph shows group delay accuracy with type-N connectors, full 2-port calibration and a 10 Hz IF bandwidth.

- Calibration kit (85032F).
- Insertion loss is assumed to be < 2 dB.

In general, the following formula can be used to determine the accuracy (in seconds) of a specific group delay measurement:  
 $\pm \text{phase accuracy (degrees)} / [360 \times \text{aperture (Hz)}]$

Figure 11. Group delay

1. Group delay is computed by measuring the phase change within a specified step (determined by the frequency span and the number of points per sweep).

## Measurement Throughput Summary

Measurement throughput data is supplemental performance data. Common condition for the measurement throughput data:

- Analyzer display turned off with: DISP : ENAB OFF
- Number of traces = 1
- firmware version: A.01.00

### Cycle time for measurement completion

1. Measured using a VEE Pro 7.0 program running on a 3.2 GHz Pentium 4 DELL Precision 370, Transferred complex S11 data, using : CALC{1-36} : DATA : FDAT?.

2. USB Test and Measurement Class (TMC) interface that communicates over USB, complying with the IEEE 488.1 and IEEE 488.2 standards.

3. Measured using an E5072A VBA macro running inside the analyzer. Transferred complex S11 data
