#### Additional Canvas Add-ons

A variety of additional Canvas boards created by our Partners that provide curated engineering education learning, design, and system integration experiences are available for the Analog Discovery Studio Max. The complete list of Canvas boards is available to review on Digilent's Reference site at <a href="https://digilent.com/reference/test-and-measurement/analog-discovery-studio-max/canvases/start">https://digilent.com/reference/test-and-measurement/analog-discovery-studio-max/canvases/start</a>.

# 2 WaveForms Software

Digilent's free WaveForms software offers a unified device experience across all our Test and Measurement devices, enabling use of all hardware features and instruments. It features a friendly user interface that has the feel of traditional benchtop devices. WaveForms makes it easy to acquire, visualize, store, analyze, produce, and reuse both analog and digital signals simultaneously.

For even more customization potential, the free WaveForms Software Development Kit (SDK) can be used to create custom applications and scripts to control the T&M device in Python, C, and additional languages.

WaveForms is Windows, Mac, and Linux compatible.

### 2.1 Oscilloscope

The Oscilloscope instrument captures analog input data via the analog input scope channels. When this instrument is used, the Analog Discovery Studio Max's analog input channels act as a two channel, 14-bit, 50 MHz bandwidth, 100 MS/s oscilloscope. Multiple sample and triggering modes are supported.

### 2.2 Waveform Generator

The Waveform Generator instrument can output analog voltage waveforms. The instrument supports everything from simple waveforms like Sine and Triangle waves, up to more complicated functions like AM and FM modulation. Custom sets of samples can be defined by the user in applications like Excel and imported to WaveForms.

### 2.3 Power Supplies

The Analog Discovery Studio Max has two variable power supply rails that can be used to power circuits under test at up to 500 mA per channel. These rails can be set to voltage levels between 0.5 V to 15 V and -0.5 V to -15 V.

Fixed +15 V, -15 V, 5 V, and 3.3 V rails are also available, but are not controlled from software.

### 2.4 Digital Multimeter

The Analog Discovery Studio Max has a pair of Digital Multimeter inputs, letting users take a variety of individual measurements including voltage, current, resistance, diode, and continuity measurements. Each measurement also supports a tare system to easily eliminate unwanted offset.

### 2.5 Voltmeter

The Analog Discovery Studio Max's four oscilloscope channels can be used with WaveForms' Voltmeter instrument to act as a simple voltmeter. DC voltages, AC RMS voltages, and True RMS voltages can be viewed for each of the four Scope channels.

### 2.5 Data Logger

The Data Logger instrument can capture large buffers of analog input data on the Scope pins. The Data Logger can capture buffers of data at update rates of up to 1000 samples per second. The maximum duration of a log is dependent on the update rate, but at the extreme, can run for over a thousand hours.

### 2.6 Logic Analyzer

With the Logic Analyzer, the 16 digital input/output channels are configured to capture high/low logic states. These 3.3 V channels are tolerant to voltages of up to 5 V. Certain Canvases can expose 8 additional DIO channels for up to 24 channels in total.

Individual input/output channels can be grouped as buses and protocols. Protocol groups can be used to view the decoded contents of packets of many common communications protocols, including SPI, I2C, UART, CAN, and I2S.

Signal states, decoded bus values, and decoded protocols can be used to trigger a Logic Analyzer capture. Protocol triggers include protocol-specific events, like start-oftransmission, end-of-transmission, or packet contents matching a user-specified value.

### 2.7 Pattern Generator

The Pattern Generator can generate logic signal sequences on the digital input/output pins. The pins can be configured to be push/pull, open drain, open source, or three-state logic. Sample rates can go as high as 100 MS/s.

Various patterns can be generated, including clocks, random signals, multiple counter types, and fully custom digital data. ROM logic can map digital input pins to digital outputs, using user-defined truth tables.

### 2.8 Static I/O

The Static I/O instrument can emulate a variety of user input/output devices on the digital input/output pins. Virtual LEDs, buttons, switches, sliders, and displays can be assigned to specific digital I/O pins and interacted with within the WaveForms user interface.

### 2.9 Spectrum Analyzer

The Spectrum Analyzer instrument is used to view the power of frequency-domain components of analog signals captured on the analog input channels. Cursors and automatic measurements include noise floor, SFDR, SNR, THD and more.

### 2.10 Network Analyzer

The Network Analyzer instrument can be used to view the amplitude and phase response of a circuit under test. Bode, Nichols, and Nyquist plots can also be viewed with this instrument. The Network Analyzer instrument uses the analog output and analog input channels of the Analog Discovery Studio Max to probe a test circuit, by generating a frequency sweep and measuring the circuit's response. The Network Analyzer can be configured to use an external signal to provide input to the circuit under test, rather than using the analog output channels.

### 2.11 Impedance Analyzer

The Impedance Analyzer instrument is used to view a wide variety of frequency response characteristics of a circuit under test. Input, Phase, Voltage, Current, Impedance, Admittance, Inductance, Factor, and Nyquist plots are all available. In addition, Custom plots can be used to present the results of a wide variety of different mathematical operations on buffered data.

### 2.12 Tracer

The Tracer instrument analyzes the characteristics of discrete semiconductor devices like diodes, NPN and PNP transistors, and both P-Type and N-Type FETs.

The dedicated IV Analyzer on the Analog Discovery Studio Max includes built-in reference resistors for accurate measurements as well as the option to operate externally for more custom designs.

### 2.12 Protocol Analyzer

The Protocol Analyzer instrument generates and analyzes common communications protocols. UART, SPI, I2C, CAN, and various other kinds of transactions can be received, transmitted, and/or spied upon (depending on the protocol) by the Analog Discovery Studio Max using any of the digital input/output channels. Custom scripts can be written within the Protocol Analyzer instrument to generate sequences of SPI or I2C transactions.

### 2.13 WaveForms Script Editor

Each of WaveForms' instruments can be controlled through scripts within the WaveForms application itself. WaveForms' "Script" instrument allows the user to write and run JavaScript code that can control the rest of the application through an extensive API. This allows the user to configure and run many instruments at the same time, in an easily repeatable way.

### 4.8 **Device Configurations**

The Analog Discovery Studio Max has one configuration which can be applied, primarily affecting the analog input, analog output, and digital I/O buffer sizes available to the user.

Configuration	Scope Buffer Size	Wavegen Butter Size	Logic Buffer Size	Patterns Buffer Size
1 (Default)	32 kS 16-bit buffer per channel, 2k 13-bit noise buffer for each channel	16 kS 14-bit carrier buffer per channel, 4 kS 15-bit AM and FM buffers 4 kS variable Power Supply buffers	32 kS per channel	16 kS per channel

**Note:** Memory sizes, including buffer sizes, specified in units like kS and MS, are rounded from equivalent binary power units, such as MiS. For example, a listed 16 kS is rounded from 16 kiS, which is 16,384 samples.

<sup>&</sup>lt;sup>1</sup> Aggregate power limits apply. The Analog Discovery Studio MAX can provide up to 40 W for simultaneous use on the USB host ports, fixed user power supplies, and the variable power supplies.

<sup>&</sup>lt;sup>2</sup> Power up sequencing of the voltage rails is first the 5 V rail, followed by the 3.3 V rail, followed concurrently by both the 15 V and -15 V rails.

<sup>&</sup>lt;sup>3</sup> Exceeding this limit will trigger the protection circuitry. This limit applies to both constant and inrush current.
