Accuracy

Thermocouple measurement accuracy

Thermocouple accuracy specifications, including typical CJC measurement error. All specifications are (\pm).

- Note 1:** Thermocouple measurement accuracy specifications include polynomial linearization, cold-junction compensation error, and system noise. Accuracies shown do not include inherent thermocouple error or large temperature gradients across the board. Contact your thermocouple supplier for details on the inherent thermocouple accuracy error. The accuracy specifications assume the device has been warmed up for the recommended 15 minutes.
- Note 2:** To avoid excessive cold-junction compensation errors, operate the device in a stable temperature environment and away from heat sources that could cause temperature gradients across the board. Refer to the documentation for ways to decrease this error.
- Note 3:** When thermocouples are attached to conductive surfaces, the voltage differential between multiple thermocouples must remain within ± 0.8 V. For best results MCC recommends using electrically insulated thermocouples when possible.
