## Chapter 6 Specifications

This chapter lists the technical specifications and general specifications of the RF signal generator. The technical specifications are valid when the instrument is within the calibration period, is stored for at least two hours in $0^{\circ} \mathrm{C}$ to $50^{\circ} \mathrm{C}$ temperature and is warmed up for 40 minutes. Unless otherwise noted, the specifications in this manual include the measurement uncertainty.

Typical Value (typ.): the typical performance that 80 percent of the measurement results can meet at room temperature (approximately $25^{\circ} \mathrm{C}$ ). This data is not warranted and does not include the measurement uncertainty.

Nominal Value (nom.): the expected average performance or the designed performance attribute (for example, the $50 \Omega$ connector). This data is not warranted and is measured at room temperature (approximately $25^{\circ} \mathrm{C}$ ).

Measured Value (meas.): the performance attribute measured during the design phase and used to be compared with the expected performance (for example, the variation of the amplitude drift with time). This data is not warranted and is measured at room temperature (approximately $25^{\circ} \mathrm{C}$ ).

Note: Unless otherwise noted, all the values in this chapter are the measurement results of multiple instruments at room temperature.
