This command sets or queries the CAN bus trigger identifier (address) mode to be used when searching on a CAN bus signal. The search number is specified by x. The search condition must be set to IDANDDATA or DATA.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:IDentifier:MODE  
{EXTENDED|STANDARD}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:IDentifier:MODE?

**Arguments** EXTENDED specifies the extended identifier mode.  
STANDARD specifies the standard identifier mode.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CAN:IDentifier:MODE EXTEND sets the identifier mode to extended.

SEARCH:SEARCH1:TRIGger:A:BUS:CAN:IDentifier:MODE? might return  
SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:IDENTIFIER:MODE STANDARD,  
indicating the identifier mode is set to standard.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:IDentifier:VALue

This command sets or queries CAN bus trigger identifier (address) value to be used when searching on a CAN bus signal. The search number is specified by x. The search condition must be set to IDANDDATA or DATA.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:IDentifier:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:IDentifier:VALue?

**Arguments** <QString> is the identifier value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CAN:IDentifier:VALue "1010" sets the identifier value to 1010.

SEARCH:SEARCH1:TRIGger:A:BUS:CAN:IDentifier:VALue? might return  
SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:IDENTIFIER:VALUE "101011",  
indicating the identifier value is 101011.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:SIZE

This command sets the length of the data string, in bytes, to be used when triggering on a CAN bus signal. The trigger condition must be set to Priority Identifier. The search number is specified by x.

**Conditions** Requires option SRAUTO.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:SIZE?

**Arguments** <NR1> specifies the data size.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CAN:PIDentifier:SIZE 2 specifies the data size as 2.

SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:PIDentifier:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:PIDentifier:SIZE 1, indicating the data size is set to 1.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:VALue

This command sets the binary data value to use when triggering on a CAN bus signal when standard is XL. The trigger condition must be set to Priority Identifier. The search number is specified by x.

**Conditions** Requires option SRAUTO.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:PIDentifier:VALue?

**Arguments** <QString> specifies the identifier value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CAN:PIDentifier:VALue "1010" specifies the identifier value as 1010.

SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:PIDentifier:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CAN:PIDentifier:VALue "101011", indicating the identifier value is set to 101011.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CAN:XLDA:SIZE

This command sets or queries the length of the data string, in bytes, to be used when searching on a CAN bus signal. The search condition must be set to IDANDDATA or DATA. The search number is specified by x.

**Conditions** Requires option SRAUTO.

| <b>Arguments</b>  | SOT specifies SOT as the field within a CPHY frame to search on.<br>EOT specifies EOT as the field within a CPHY frame to search on.<br>DATA specifies DATA as the field within a CPHY frame to search on<br>EOTPDATa specifies EOTPDATa as the field within a CPHY frame to search on.<br>OPTIONALPARAm specifies OPTIONALPARAm as the field within a CPHY frame to search on.<br>SCRAMbling specifies SCRAMbling as the field within a CPHY frame to search on. |

**COMP**ression specifies COMPression as the field within a CPHY frame to search on.

**PACK**ets specifies PACKets as the field within a CPHY frame to search on.

**BUSTURNAROUN**d specifies BUSTURNAROUNd as the field within a CPHY frame to search on.

**ESCAPE**MODE specifies ESCAPEMODE as the field within a CPHY frame to search on.

**ST**op specifies STop as the field within a CPHY frame to search on.

**ERR**ors specifies ERRors as the field within a CPHY frame to search on.

**MO**de specifies MODe as the field within a CPHY frame to search on.

**WORD** specifies WORD as the field within a CPHY frame to search on.

**SYMBOL** specifies SYMBOL as the field within a CPHY frame to search on.

**Examples** `SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:CONDition SOT` specifies SOT as the field within a CPHY frame to search on.

`SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:CONDition?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:CONDition SOT`, indicating that SOT is the currently specified field within a CPHY frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:SIZE**

This command specifies the length of the data string in bytes to be used for an CPHY trigger if the trigger condition is DATA.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** `SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:SIZE <NR1>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:SIZE?`

**Arguments** <NR1> specifies the data size. The default data size is 1 byte and otherwise ranges between 1 and 5.

**Examples** `SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:DATA:SIZE 2` specifies 2 as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:DATA:SIZE? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:DATA:SIZE 1, indicating that 2 is  
the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:VALue

This command specifies the binary data string used for CPHY triggering if the trigger condition is DATA.

|                   |                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CPHY.                                                                                                                                                                                                                                                                                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                               |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:DATA:VALue?                                                                                                                                                                                                                                                   |
| <b>Arguments</b>  | <QString> is the identifier value. The default value is XXXXXXXX.                                                                                                                                                                                                                                                                                             |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:DATA:VALue "11110000"<br>specifies 11110000 as the field within a CPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:DATA:VALue? might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:DATA:VALue "11110000",<br>indicating that 11110000 is the currently specified field within a CPHY frame<br>to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ERRor:TYPE

This command sets or queries the error type for CPHY bus. The default error type condition is ANY.

|                   |                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CPHY.                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                 |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ERRor:TYPE {ANY ECC CRC}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ERRor:TYPE? |

**Arguments** ANY specifies ANY as the field within a CPHY frame to search on.  
 ECC specifies ECC as the field within a CPHY frame to search on.  
 CRC specifies CRC as the field within a CPHY frame to search on

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:ERRor:TYPe ECC specifies ECC as the field within a CPHY frame to search on.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:ERRor:TYPe? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:ERRor:TYPe ECC, indicating that ECC is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD

This command sets or queries the escape mode command type for CPHY bus..

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD {LPDT|ULPS|RESEtTRIGger|ANY}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD?

**Arguments** LPDT specifies LPDT as the field within a CPHY frame to search on.  
 ULPS specifies ULPS as the field within a CPHY frame to search on.  
 RESEtTRIGger specifies RESEtTRIGger as the field within a CPHY frame to search on  
 ANY specifies ANY as the field within a CPHY frame to search on. ANY is the default value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD ULPS specifies ULPS as the field within a CPHY frame to search on.  
 SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:ESCAPEMODE:COMManD ULPS, indicating that ULPS is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:GREen:VALue

This command specifies the green data string used for CPHY triggering if the trigger condition is on RGB packet.

|                   |                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CPHY.                                                                                                                                                                                                                                                                                                         |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:GREen:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:GREen:VALue?                                                                                                                                                                                                                    |
| <b>Arguments</b>  | <QString> is the identifier value. The default green value is XXXXXXXXXXXX.                                                                                                                                                                                                                                                      |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:GREen:VALue "243" specifies 243 as the field within a CPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:GREen:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:GREen:VALue "243", indicating that 243 is the currently specified field within a CPHY frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:MODE:TYPE

This command sets or queries the mode type for CPHY bus.

|                   |                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CPHY.                                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:MODE:TYPE {HS LP}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:MODE:TYPE?                                                               |
| <b>Arguments</b>  | HS specifies HS as the mode within a CPHY frame to search on. HS is default mode type condition.<br><br>LP specifies LP as the mode within a CPHY frame to search on. |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:MODE:TYPE LP specifies LP as the mode within a CPHY frame to search on.                                                             |

SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:MODe:TYPe? might return  
:SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:MODe:TYPe LP, indicating that  
LP is the currently specified mode within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PACKets:LIST

This command sets or queries the packet list for CPHY bus. The default packet list condition is VSYNCSTART.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PACKets:LIST  
{VSYNCSTART| VSYNCEND| HSYNCSTART| HSYNCEND| EOTP| COLOROFF|  
COLORON| SHUTDOWN| TURNON| GSW| GR| COMPRESSION| SCRAMBLING|  
EXECUTEQUEue| DCSSW| DCSR| GLONGWRITE| DSINULL| DSIBLANK|  
MAXRETSIZE| DCSGLONGWRITE| PICPARAmeter| COMPRESSEDPSStream|  
PPS101010| PPS121212| PPS565| PPS666| LPS666| PPS888|  
YBCR24| LPYBCR24| YBCR16| YBCR12| ACKNowledge|  
ERRORREPort| GSRR| GLONGREAD| DCSLONGREAD| DCSSRR|  
FRAMEStArt| FRAMEEND| LINEStArt| LINEEND| GSP| CSINULL|  
CSIBLANK| EMBEDDED| USEREIGHTB| RGB565| RGB555| RGB444|  
RGB666| RAW6| RAW7| RAW8| RAW10| RAW12| RAW14| RAW16| RAW20|  
RGB888| YUV420L8| YUV8BIT| YUV422B10| YUV420B10}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PACKets:LIST?

**Arguments** VSYNCSTART specifies VSYNCSTART as the packet within CPHY frame to search on.

VSYNCEND specifies VSYNCEND as the packet within CPHY frame to search on.

HSYNCSTART specifies HSYNCSTART as the packet within CPHY frame to search on.

HSYNCEND specifies HSYNCEND as the packet within CPHY frame to search on.

EOTP specifies EOTP as the packet within CPHY frame to search on.

COLOROFF specifies COLOROFF as the packet within CPHY frame to search on.

COLORON specifies COLORON as the packet within CPHY frame to search on.

SHUTDOWN specifies SHUTDOWN as the packet within CPHY frame to search on.

TURNON specifies TURNON as the packet within CPHY frame to search on.

GSW specifies GSW as the packet within CPHY frame to search on.

GR specifies GR as the packet within CPHY frame to search on.

COMPRESSION specifies COMPRESSION as the packet within CPHY frame to search on.

SCRAMBLING specifies SCRAMBLING as the packet within CPHY frame to search on.

EXECUTEQUEue specifies EXECUTEQUEue as the packet within CPHY frame to search on.

DCSSW specifies DCSSW as the packet within CPHY frame to search on.

DCSR specifies DCSR as the packet within CPHY frame to search on.

GLONGWRITE specifies GLONGWRITE as the packet within CPHY frame to search on.

DSINULL specifies DSINULL as the packet within CPHY frame to search on.

DSIBLANK specifies DSIBLANK as the packet within CPHY frame to search on.

MAXRETSIZE specifies MAXRETSIZE as the packet within CPHY frame to search on.

DCSGLONGWRITE specifies DCSGLONGWRITE as the packet within CPHY frame to search on.

PICPARAMeter specifies PICPARAMeter as the packet within CPHY frame to search on.

COMPRESSEDPSTream specifies COMPRESSEDPSTream as the packet within CPHY frame to search on.

PPS101010 specifies PPS101010 as the packet within CPHY frame to search on.

PPS121212 specifies PPS121212 as the packet within CPHY frame to search on.

PPS565 specifies PPS565 as the packet within CPHY frame to search on.

PPS666 specifies PPS666 as the packet within CPHY frame to search on.

LPS666 specifies LPS666 as the packet within CPHY frame to search on.

PPS888 specifies LPS666 as the packet within CPHY frame to search on.

YCBCR24 specifies YCBCR24 as the packet within CPHY frame to search on.

LPYCBCR24 specifies LPYCBCR24 as the packet within CPHY frame to search on.

YCBCR16 specifies YCBCR16 as the packet within CPHY frame to search on.

YCBCR12 specifies YCBCR12 as the packet within CPHY frame to search on.

ACKNOWLEDge specifies ACKNOWLEDge as the packet within CPHY frame to search on.

**ERRORREPort** specifies ERRORREPort as the packet within CPHY frame to search on.

**GSRR** specifies GSRR as the packet within CPHY frame to search on.

**GLONGREAD** specifies GLONGREAD as the packet within CPHY frame to search on.

**DCSLONGREAD** specifies DCSLONGREAD as the packet within CPHY frame to search on.

**DCSSRR** specifies DCSSRR as the packet within CPHY frame to search on.

**FRAMESTART** specifies FRAMESTART as the packet within CPHY frame to search on.

**FRAMEEND** specifies FRAMEEND as the packet within CPHY frame to search on.

**LINESTART** specifies LINESTART as the packet within CPHY frame to search on.

**LINEEND** specifies LINEEND as the packet within CPHY frame to search on.

**GSP** specifies GSP as the packet within CPHY frame to search on.

**CSINULL** specifies CSINULL as the packet within CPHY frame to search on.

**CSIBLANK** specifies CSIBLANK as the packet within CPHY frame to search on.

**EMBEDDED** specifies EMBEDDED as the packet within CPHY frame to search on.

**USEREIGHTB** specifies USEREIGHTB as the packet within CPHY frame to search on.

**RGB565** specifies RGB565 as the packet within CPHY frame to search on.

**RGB555** specifies RGB555 as the packet within CPHY frame to search on.

**RGB444** specifies RGB444 as the packet within CPHY frame to search on.

**RGB666** specifies RGB666 as the packet within CPHY frame to search on.

**RAW6** specifies RAW6 as the packet within CPHY frame to search on.

**RAW7** specifies RAW7 as the packet within CPHY frame to search on.

**RAW8** specifies RAW8 as the packet within CPHY frame to search on.

**RAW10** specifies RAW10 as the packet within CPHY frame to search on.

**RAW12** specifies RAW12 as the packet within CPHY frame to search on.

**RAW14** specifies RAW14 as the packet within CPHY frame to search on.

**RAW16** specifies RAW16 as the packet within CPHY frame to search on.

**RAW20** specifies RAW20 as the packet within CPHY frame to search on.

**RGB888** specifies RGB888 as the packet within CPHY frame to search on.

YUV420L8 specifies YUV420L8 as the packet within CPHY frame to search on.

YUV8BIT specifies YUV8BIT as the packet within CPHY frame to search on.

YUV422B10 specifies YUV422B10 as the packet within CPHY frame to search on.

YUV420B10 specifies YUV420B10 as the packet within CPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:LIST VSYNCSTART specifies VSYNCSTART of set command as the packet within CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:LIST? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:LIST VSYNCSTART, indicating that VSYNCSTART is the currently the packet within CPHY frame to search on

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:PACKets:TYPE

This command sets or queries the packet type for CPHY bus.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:PACKets:TYPE {SHORT|LONG}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:PACKets:TYPE?

**Arguments** SHORT specifies SHORT as the field within a CPHY frame to search on. SHORT is the default packet type condition.

LONG specifies LONG as the field within a CPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:TYPE LONG specifies LONG as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PACKets:TYPE LONG, indicating that LONG is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:NUMBer

This command specifies the pixel number to be used for CPHY triggering if the trigger condition is on pixel number pattern. The search number is specified by x.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:NUMBer <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:NUMBer?

**Arguments** <NR1> specifies the pixel number. The default pixel number value is 0

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:PIXel:NUMBer 1234 specifies 1234 as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PIXel:NUMBer? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PIXel:NUMBer 1234, indicating that 1234 is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:SEARCHOPTion

This command sets or queries the search pattern type for CPHY bus. The default search pattern type value is PIXELVALue.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:SEARCHOPTion  
{PIXELVALue|PIXELNUMBER}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:PIXel:SEARCHOPTion?

**Arguments** PIXELVALue specifies PIXELVALue as the field within a CPHY frame to search on.

PIXELNUMBER specifies PIXELNUMBER as the field within a CPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PIXEL:SEARCHOPTION  
PIXELNUMBER specifies PIXELNUMBER as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PIXEL:SEARCHOPTION? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:PIXEL:SEARCHOPTION  
PIXELNUMBER, indicating that PIXELNUMBER is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:RED:VALUE

This command specifies the red data string used for CPHY triggering if the trigger condition is on RGB packet.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:RED:VALUE <QString>  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:RED:VALUE?

**Arguments** <QString> is the identifier value. The default red value is XXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:RED:VALUE "1A1" specifies 1A1 as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:RED:VALUE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:RED:VALUE "1A1", indicating that 1A1 is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:CPHY:SYMBOL:SIZE

This command specifies the length of the data string in bytes to be used for an CPHY trigger if the trigger condition is SYMBOL. The search number is specified by x.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

| <b>Arguments</b>  | <QString> specifies the binary data string. The default data value is XXXXXXXXXXXXXXXXXXXX.                                                                                                                                                                                                                                                       |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORD:VALue "11110000" specifies 11110000 as the field within a CPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORD:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORD:VALue "11110000", indicating that 11110000 is the currently specified field within a CPHY frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue

This command specifies the word count data string used for CPHY triggering if the trigger condition is on any rgb/ycbcr/yuv packet. The search number is specified by x.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue?

**Arguments** <QString> specifies the word count data string. The default data value is XXXXXXXXXXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue "0003" specifies 0003 as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:WORDCOUNT:VALue "0003", indicating that 0003 is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CB

This command specifies the Cb data string used for CPHY triggering if the trigger condition is on YCbCr packet. The search number is specified by x.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CB <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CB?

**Arguments** <QString> is the identifier value. The default YCBCR packets CB value is XXXXXXXXXXXX.

- Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YCBCR:CB "1BA" specifies 1BA as the field within a CPHY frame to search on.
- SEARCH:SEARCH1:TRIGGER:A:BUS:CPHY:YCBCR:CB? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YCBCR:CB "1BA", indicating that 1BA is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CR

This command specifies the Cr data string used for CPHY triggering if the trigger condition is on YCbCr packet. The search number is specified by x.

- Conditions** Requires option SR-CPHY.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CR <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:CR?
- Arguments** <QString> is the identifier value. The default YCBCR packets CR value is XXXXXXXXXXXX.
- Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YCBCR:CR "2EE" specifies 2EE as the field within a CPHY frame to search on.
- SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YCBCR:CR? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YCBCR:CR "2EE", indicating that 2EE is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:Y

This command specifies the Y data string used for CPHY triggering if the trigger condition is on YCbCr packet. The search number is specified by x.

- Conditions** Requires option SR-CPHY.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:Y <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YCBCR:Y?

|                  |                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <QString> is the identifier value. The default YCBCR packets Y value is XXXXXXXXXXXX.                                                                                                                                                                                                                             |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YBCR:Y "1AA" specifies 1AA as the field within a CPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YBCR:Y? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YBCR:Y "1AA", indicating that 1AA is the currently specified field within a CPHY frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:U

This command specifies the U data string used for CPHY triggering if the trigger condition is on YUV packet. The search number is specified by x.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:V

This command specifies the V data string used for CPHY triggering if the trigger condition is on YUV packet. The search number is specified by x.

|                   |                          |
|-------------------|--------------------------|
| <b>Conditions</b> | Requires option SR-CPHY. |
| <b>Group</b>      | Search and Mark          |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:V <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:V?

**Arguments** <QString> is the identifier value. The default YUV packets V value is XXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:V "12A" specifies 12A as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:V? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:V "12A", indicating that 12A is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:Y

This command specifies the Y data string used for CPHY triggering if the trigger condition is on YUV packet. The search number is specified by x.

**Conditions** Requires option SR-CPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:Y <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:CPHY:YUV:Y?

**Arguments** <QString> is the identifier value. The default YUV packets Y value is XXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:Y "81A" specifies 12A as the field within a CPHY frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:Y? might return :SEARCH:SEARCH1:TRIGger:A:BUS:CPHY:YUV:Y "81A", indicating that 81A is the currently specified field within a CPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:CONDition

This command sets or queries the trigger condition for a CXPI bus. The search number is specified by x.

**Conditions** Requires option SR-CXPI .

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:ERROR:TYPE CRC sets the Error Type as CRC.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:ERROR:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:ERROR:TYPE CRC, indicating the type of the error is CRC.                                                                                                                                                                           |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:EXTDLC:VALue

This command specifies the binary DLC string used for CXPI triggering if the trigger condition is Ext DLC. The search number is specified by x.

|                   |                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CXPI.                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                 |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:EXTDLC:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:EXTDLC:VALue? |

- Arguments** <QString> is the identifier value. The default size and value of Ext DLC is 8 bits and "XXXX XXXX" respectively.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:EXTDLC:VALUE "11010010" specifies the binary DLC string used for CXPI triggering if the trigger condition is Ext DLC as "1010010".
- SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:EXTDLC:VALUE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:EXTDLC:VALUE "110", indicating the value of the Ext DLC is "11010010".

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:CXPI:FRAME:TYPE

This command sets or queries the frame type in CXPI bus. The search number is specified by x.

- Conditions** Requires option SR-CXPI.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:CXPI:FRAME:TYPE {NORMAL|SLEEp|LONG|POLLINGNORMAL|POLLINGLONG}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:CXPI:FRAME:TYPE?
- Arguments** NORMAL specifies NORMAL as the packet type CXPI frame to search on. The default frame type is normal.
- SLEEp specifies SLEEp as the packet type CXPI frame to search on.
- LONG specifies LONG as the packet type CXPI frame to search on.
- POLLINGNORMAL specifies POLLINGNORMAL as the packet type CXPI frame to search on.
- POLLINGLONG specifies POLLINGLONG as the packet type CXPI frame to search on.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAME:TYPE SLEEp specifies the frame type as sleep.
- SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAME:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAME:TYPE SLEEp, indicating the type of the frame to sleep.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:FRAMEID:VALue

This command specifies the binary frameId string used for CXPI triggering if the trigger condition is FRAMEID. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CXPI.                                                                                                                                                                                                                                                                                                                                       |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:FRAMEID:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:FRAMEID:VALue?                                                                                                                                                                                                                                              |
| <b>Arguments</b>  | <QString> is the identifier value. The default size and value of frame ID is 7 bits and "XXX XXXX" respectively.                                                                                                                                                                                                                                               |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAMEID:VALue "1000"<br>specifies the binary frameId string used for CXPI triggering if the trigger condition is FRAMEID as "XXX1000".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAMEID:VALue? might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:FRAMEID:VALue "1000",<br>indicating the value of the frameId is "XXX1000". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:SLEEPIND

This command sets or queries the Sleep Status in CXPI bus. The search number is specified by x.

|                   |                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-CXPI.                                                                                                                                         |
| <b>Group</b>      | Search and Mark                                                                                                                                                  |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:SLEEPIND<br>{ON OFF EITHER}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:SLEEPIND?                                     |
| <b>Arguments</b>  | ON specifies the Sleep Status as on. The default status is on.<br><br>OFF specifies the Sleep Status as off.<br><br>EITHER specifies the Sleep Status as either. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:SLEEPIND OFF` specifies the Sleep Status as off.

`SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:SLEEPIND?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:SLEEPIND OFF`, indicating the status of the Sleep to off.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:WAKEUPIND**

This command sets or queries the Wakeup Status in CXPI bus. The search number is specified by x.

**Conditions**     Requires option SR-CXPI.

**Group**            Search and Mark

**Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:WAKEUPIND`  
                          `{ON|OFF|EITHER}`  
                          `SEARCH:SEARCH<x>:TRIGger:A:BUS:CXPI:NETMN:WAKEUPIND?`

**Arguments**     `ON` specifies the Wakeup Status as on. The default status is on.

`OFF` specifies the Wakeup Status as off.

`EITHER` specifies the Wakeup Status as either.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:WAKEUPIND ON` specifies the Wakeup Status as on.

`SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:WAKEUPIND?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:CXPI:NETMN:WAKEUPIND ON`, indicating the status of the Wakeup to on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:BLUe:VALue**

This command specifies the blue data string used for DPHY triggering if the trigger condition is on RGB packet.

**Conditions**     Requires option SR-DPHY.

**Group**            Search and Mark

|                  |                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | <code>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:DPHY:BLUe:VALUe &lt;QString&gt;</code><br><code>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:DPHY:BLUe:VALUe?</code>                                                                                                                                                                                                          |
| <b>Arguments</b> | <QString> is the identifier value. The default blue value is XXXXXXXXXXXX.                                                                                                                                                                                                                                                                                       |
| <b>Examples</b>  | <code>SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:BLUe:VALUe "BE4"</code> specifies BE4 as the field within a DPHY frame to search on.<br><code>SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:BLUe:VALUe?</code> might return <code>SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:BLUe:VALUe "BE4"</code> , indicating that BE4 is the currently specified field within a DPHY frame to search on. |

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:CONDition**

This command sets or queries the trigger condition for an DPHY bus. The default trigger on condition is SOT.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Arguments</b>  | SOT specifies SOT as the field within a DPHY frame to search on.<br>EOT specifies EOT as the field within a DPHY frame to search on.<br>DATA specifies DATA as the field within a DPHY frame to search on<br>EOTPDATa specifies EOTPDATa as the field within a DPHY frame to search on.<br>OPTIONALPARAm specifies OPTIONALPARAm as the field within a DPHY frame to search on.<br>SCRAmbling specifies SCRAmbling as the field within a DPHY frame to search on.<br>COMPResion specifies COMPResion as the field within a DPHY frame to search on.<br>PACKets specifies PACKets as the field within a DPHY frame to search on. |

BUSTURNAROUNd specifies BUSTURNAROUNd as the field within a DPHY frame to search on.

ESCAPEMODE specifies ESCAPEMODE as the field within a DPHY frame to search on.

STOp specifies STOp as the field within a DPHY frame to search on.

ERRoRs specifies ERRoRs as the field within a DPHY frame to search on.

MODE specifies MODE as the field within a DPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:CONDition SOT specifies SOT as the field within a DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:CONDition? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:CONDition SOT, indicating that SOT is the currently specified field within a DPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:SIZE

This command specifies the length of the data string in bytes to be used for an DPHY trigger if the trigger condition is DATA. The default data size is 1 byte and ranges between 1 and 5. The search number is specified by x.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:SIZE?

**Arguments** <NR1> specifies the data size.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:DATA:SIZE 2 specifies 2 as the field within a DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:DATA:SIZE 2, indicating 2 is the currently specified field within a DPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:VALue

This command specifies the binary data string used for DPHY triggering if the trigger condition is DATA.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:DATA:VALue?

**Arguments** <QString> is the identifier value. The default value is XXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:DATA:VALue "11110000"  
specifies 11110000 as the field within a DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:DATA:VALue? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:DATA:VALue "11110000",  
indicating that 11110000 is the currently specified field within a DPHY frame  
to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ERRor:TYPE

This command sets or queries the error type for DPHY bus. The default error type condition is ANY.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ERRor:TYPE {ANY|ECC|CRC}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ERRor:TYPE?

**Arguments** ANY specifies ANY as the field within a DPHY frame to search on.  
ECC specifies ECC as the field within a DPHY frame to search on.  
CRC specifies CRC as the field within a DPHY frame to search on

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:ERRor:TYPe ECC` specifies ECC as the field within a DPHY frame to search on.

`SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:ERRor:TYPe?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:ERRor:TYPe ECC`, indicating that ECC is the currently specified field within a DPHY frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD**

This command sets or queries the escape mode command type for DPHY bus.

**Conditions**     Requires option SR-DPHY.

**Group**          Search and Mark

**Syntax**         `SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD`  
                       `{LPDT|ULPS|RESEtTRIGger|ANY}`  
                       `SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD?`

**Arguments**     LPDT specifies LPDT as the field within a DPHY frame to search on.

                      ULPS specifies ULPS as the field within a DPHY frame to search on.

                      RESEtTRIGger specifies RESEtTRIGger as the field within a DPHY frame to search on

                      ANY specifies ANY as the field within a DPHY frame to search on. ANY is the default value.

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD ULPS` specifies ULPS as the field within a DPHY frame to search on.

`SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD?` might return `:SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:ESCAPEMODE:COMManD ULPS`, indicating that ULPS is the currently specified field within a DPHY frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:GREen:VALue**

This command specifies the green data string used for DPHY triggering if the trigger condition is on RGB packet.

**Conditions**     Requires option SR-DPHY.

|                  |                                                                                                                                                                                                                                                                                                                                  |

**SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:LIST**

This command sets or queries the packet list for DPHY bus. The default packet list condition is VSYNCSTART.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:LIST  
 {VSYNCSTART| VSYNCEND| HSYNCSTART| HSYNCEND| EOTP| COLOROFF|  
 COLORON| SHUTDOWN| TURNON| GSW| GR| COMPRESSION| SCRAMBLING|  
 EXECUTEQUEue| DCSSW| DCSR| GLONGWRITE| DSINULL| DSIBLANK|  
 MAXRETSIZE| DCSGLONGWRITE| PICPARAMeter| COMPRESSEDPSStream|  
 PPS101010| PPS121212| PPS565| PPS666| LPS666| PPS888|  
 YBCRCR24| LPYBCRCR24| YBCRCR16| YBCRCR12| ACKNowledge|  
 ERRORREPort| GSRR| GLONGREAD| DCSLONGREAD| DCSSRR|  
 FRAMEStArt| FRAMEEND| LINESTArt| LINEEND| GSP| CSINULL|  
 CSIBLANK| EMBEDDED| USEREIGHTB| RGB565| RGB555| RGB444|  
 RGB666| RAW6| RAW7| RAW8| RAW10| RAW12| RAW14| RAW16| RAW20|  
 RGB888| YUV420L8| YUV8BIT| YUV422B10| YUV420B10}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:LIST?

**Arguments** VSYNCSTART specifies VSYNCSTART as the packet within DPHY frame to search on.

VSYNCEND specifies VSYNCEND as the packet within DPHY frame to search on.

HSYNCSTART specifies HSYNCSTART as the packet within DPHY frame to search on.

HSYNCEND specifies HSYNCEND as the packet within DPHY frame to search on.

EOTP specifies EOTP as the packet within DPHY frame to search on.

COLOROFF specifies COLOROFF as the packet within DPHY frame to search on.

COLORON specifies COLORON as the packet within DPHY frame to search on.

SHUTDOWN specifies SHUTDOWN as the packet within DPHY frame to search on.

TURNON specifies TURNON as the packet within DPHY frame to search on.

GSW specifies GSW as the packet within DPHY frame to search on.

GR specifies GR as the packet within DPHY frame to search on.

COMPRESSION specifies COMPRESSION as the packet within DPHY frame to search on.

SCRAMBLING specifies SCRAMBLING as the packet within DPHY frame to search on.

EXECUTEQUEue specifies EXECUTEQUEue as the packet within DPHY frame to search on.

DCSSW specifies DCSSW as the packet within DPHY frame to search on.

DCSR specifies DCSR as the packet within DPHY frame to search on.

GLONGWRITE specifies GLONGWRITE as the packet within DPHY frame to search on.

DSINULL specifies DSINULL as the packet within DPHY frame to search on.

DSIBLANK specifies DSIBLANK as the packet within DPHY frame to search on.

MAXRETSIZE specifies MAXRETSIZE as the packet within DPHY frame to search on.

DCSGLONGWRITE specifies DCSGLONGWRITE as the packet within DPHY frame to search on.

PICPARAMeter specifies PICPARAMeter as the packet within DPHY frame to search on.

COMPRESSEDPSTReam specifies COMPRESSEDPSTReam as the packet within DPHY frame to search on.

PPS101010 specifies PPS101010 as the packet within DPHY frame to search on.

PPS121212 specifies PPS121212 as the packet within DPHY frame to search on.

PPS565 specifies PPS565 as the packet within DPHY frame to search on.

PPS666 specifies PPS666 as the packet within DPHY frame to search on.

LPS666 specifies LPS666 as the packet within DPHY frame to search on.

PPS888 specifies LPS666 as the packet within DPHY frame to search on.

YCBCR24 specifies YCBCR24 as the packet within DPHY frame to search on.

LPYCBCR24 specifies LPYCBCR24 as the packet within DPHY frame to search on.

YCBCR16 specifies YCBCR16 as the packet within DPHY frame to search on.

YCBCR12 specifies YCBCR12 as the packet within DPHY frame to search on.

ACKNOwledge specifies ACKNOwledge as the packet within DPHY frame to search on.

ERRORREPort specifies ERRORREPort as the packet within DPHY frame to search on.

GSRR specifies GSRR as the packet within DPHY frame to search on.

GLONGREAD specifies GLONGREAD as the packet within DPHY frame to search on.

DCSLONGREAD specifies DCSLONGREAD as the packet within DPHY frame to search on.

DCSSRR specifies DCSSRR as the packet within DPHY frame to search on.

FRAMESTART specifies FRAMESTART as the packet within DPHY frame to search on.

FRAMEEND specifies FRAMEEND as the packet within DPHY frame to search on.

LINESTART specifies LINESTART as the packet within DPHY frame to search on.

LINEEND specifies LINEEND as the packet within DPHY frame to search on.

GSP specifies GSP as the packet within DPHY frame to search on.

CSINULL specifies CSINULL as the packet within DPHY frame to search on.

CSIBLANK specifies CSIBLANK as the packet within DPHY frame to search on.

EMBEDDED specifies EMBEDDED as the packet within DPHY frame to search on.

USEREIGHTB specifies USEREIGHTB as the packet within DPHY frame to search on.

RGB565 specifies RGB565 as the packet within DPHY frame to search on.

RGB555 specifies RGB555 as the packet within DPHY frame to search on.

RGB444 specifies RGB444 as the packet within DPHY frame to search on.

RGB666 specifies RGB666 as the packet within DPHY frame to search on.

RAW6 specifies RAW6 as the packet within DPHY frame to search on.

RAW7 specifies RAW7 as the packet within DPHY frame to search on.

RAW8 specifies RAW8 as the packet within DPHY frame to search on.

RAW10 specifies RAW10 as the packet within DPHY frame to search on.

RAW12 specifies RAW12 as the packet within DPHY frame to search on.

RAW14 specifies RAW14 as the packet within DPHY frame to search on.

RAW16 specifies RAW16 as the packet within DPHY frame to search on.

RAW20 specifies RAW20 as the packet within DPHY frame to search on.

RGB888 specifies RGB888 as the packet within DPHY frame to search on.

YUV420L8 specifies YUV420L8 as the packet within DPHY frame to search on.

YUV8BIT specifies YUV8BIT as the packet within DPHY frame to search on.

YUV422B10 specifies YUV422B10 as the packet within DPHY frame to search on.

YUV420B10 specifies YUV420B10 as the packet within DPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:PACKets:LIST VSYNCSTART specifies VSYNCSTART of set command as the packet within DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:PACKets:LIST? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:PACKets:LIST VSYNCSTART, indicating that VSYNCSTART is the currently the packet within DPHY frame to search on

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:TYPE

This command sets or queries the packet type for DPHY bus. The default packet type condition is SHORT.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:TYPE {SHORT|LONG}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PACKets:TYPE?

**Arguments** SHORT specifies SHORT as the field within a DPHY frame to search on. SHORT is the default packet type condition.

LONG specifies LONG as the field within a DPHY frame to search on.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:PACKets:TYPE LONG specifies LONG as the field within a DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:PACKets:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:PACKets:TYPE LONG, indicating that LONG is the currently specified field within a DPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:PIXel:NUMBER

This command specifies the pixel number to be used for DPHY triggering if the trigger condition is on pixel number pattern. The search number is specified by x.

**Conditions** Requires option SR-DPHY.

|                  |                                                                                                                                                                                                                                                                                                                                     |

| <b>Arguments</b>  | <QString> is the identifier value. The default red value is XXXXXXXXXXXX.                                                                                                                                                                                                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:RED:VALue "1A1" specifies 1A1 as the field within a DPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:RED:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:RED:VALue "1A1", indicating that 1A1 is the currently specified field within a DPHY frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:WORDCOUNT:VALue

This command specifies the word count data string used for DPHY triggering if the trigger condition is set on any pixel packet.

|                   |                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-DPHY.                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:WORDCOUNT:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:WORDCOUNT:VALue? |
| <b>Arguments</b>  | <QString> is the identifier value. The default word count value is XXXXXXXXXXXXXXXXXXXX.                              |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:WORDCOUNT:VALue "0003" specifies 1A1 as the field within a DPHY frame to search on. |

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:WORDCOUNT:VALUE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:WORDCOUNT:VALUE "0003", indicating that 0003 is the currently specified field within a DPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CB

This command specifies the Cb data string used for DPHY triggering if the trigger condition is on YCbCr packet.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CB <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CB?

**Arguments** <QString> is the identifier value. The default YCBCR packets CB value is XXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:YCBCr:CB "1BA" specifies 1BA as the field within a DPHY frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:DPHY:YCBCr:CB? might return :SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:YCBCr:CB "1BA", indicating that 1BA is the currently specified field within a DPHY frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CR

This command specifies the Cr data string used for DPHY triggering if the trigger condition is on YCbCr packet.

**Conditions** Requires option SR-DPHY.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CR <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCr:CR?

|                  |                                                                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <QString> is the identifier value. The default YCBCR packets CR value is XXXXXXXXXXXX.                                                                                                                                                                                                                                  |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:YCBCR:CR "2EE" specifies 2EE as the field within a DPHY frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:YCBCR:CR? might return :SEARCH:SEARCH1:TRIGger:A:BUS:DPHY:YCBCR:CR "2EE", indicating that 2EE is the currently specified field within a DPHY frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:DPHY:YCBCR:Y

This command specifies the Y data string used for DPHY triggering if the trigger condition is on YCbCr packet.

|                   |                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-DPHY.                                                                                                                                                                                                                                                                                             |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                      |

**SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:COMMAND:OPCode**

This command sets or queries the command opcode in ESPI bus. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:COMMAND:OPCode  
 {GETSTATus| GETCONFig| SETCONFig| GETNP| GETPC| PUTNP|  
 PUTPC| PUTIORDSHORT| PUTIOWRSHORT| PUTMEMRD32SHORT|  
 PUTMEMWR32SHORT| PUTOOB| GETOOB| PUTFLASHC| GETFLASHNP|  
 PUTVWIRE| GETVWIRE}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:COMMAND:OPCode?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:PHASe](#)

**Arguments** GETSTATus specifies get status as the command opcode in ESPI bus to search on.  
 GETCONFig specifies get configuration as the command opcode in ESPI bus to search on.  
 SETCONFig specifies set configuration as the command opcode in ESPI bus to search on..  
 GETNP specifies GETNP as the command opcode in ESPI bus to search on.  
 GETPC specifies GETPC as the command opcode in ESPI bus to search on.  
 PUTNP specifies PUTNP as the command opcode in ESPI bus to search on.  
 PUTPC specifies PUTPC as the command opcode in ESPI bus to search on.  
 PUTIORDSHORT specifies put IO read short as the command opcode in ESPI bus to search on.  
 PUTIOWRSHORT specifies put IO write short as the command opcode in ESPI bus to search on.  
 PUTMEMRD32SHORT specifies put memory read 32 short as the command opcode in ESPI bus to search on.  
 PUTMEMWR32SHORT specifies put memory write 32 short as the command opcode in ESPI bus to search on.  
 PUTOOB specifies PUTOOB as the command opcode in ESPI bus to search on.  
 GETOOB specifies GETOOB as the command opcode in ESPI bus to search on.

PUTFLASHC specifies PUTFLASHC as the command opcode in ESPI bus to search on.

GETFLASHNP specifies GETFLASHNP as the command opcode in ESPI bus to search on.

PUTVWIRE specifies put virtual wire as the command opcode in ESPI bus to search on.

GETVWIRE specifies get virtual wire as the command opcode in ESPI bus to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:COMMAND:OPCode specifies the search to happen on which command opcode.

SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:COMMAND:OPCode? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:COMMAND:OPCode GETNP, indicating that command is the currently selected command opcode where the search will be performed.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CONDition

This command sets or queries the trigger condition for a ESPI bus. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CONDition {START|CHINdependent|PERICHANne1|OOBCHANne1|VWCHANne1|FACHANne1|DATA|STATUs|ERRors|WAIT|END}

SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CONDition?

**Arguments** START specifies START as the event for ESPI frame to search on.

CHINdependent specifies CHINdependent channel for ESPI protocol to search on.

PERICHANne1 specifies peripheral channel for ESPI protocol to search on.

OOBCHANne1 specifies OOBCHANnel channel for ESPI protocol to search on.

VWCHANne1 specifies virtual wire channel for ESPI protocol to search on.

FACHANne1 specifies flash channel for ESPI protocol to search on.

DATA specifies DATA as the field within a ESPI frame to search on.

STATUS specifies STATUS as the field within a ESPI frame to search on.

ERRORS specifies ERRORS as the type of error ESPI frame to search on.

WAIT specifies WAIT as the field within a ESPI frame to search on.

END specifies END as the event for a ESPI frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CONDition START specifies START as the field within a ESPI frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CONDition? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CONDition START, indicating that START is the currently specified field within a ESPI frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CYCLETYPE

This command sets or queries the cycle type on command in ESPI bus. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CYCLETYPE {MEMRD32|MEMRD64|MEMWR32|MEMWR64|MESSAGE|MSGWITHDATA|SUCCESSNODATA|SUCCESSDATA|UNSUCCESSNODATA|OBSMBUS|MCTP|FLASHREAD|FLASHWRITE|FLASHERASE|FLSUCCESSNODATA|FLSUCCESSDATA|FLUNSUCCESSNODATA}

SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:CYCLETYPE?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:PHASe](#)

**Arguments** MEMRD32 specifies Memory Read 32 as the cycle type to search on.

MEMRD64 specifies Memory Read 64 as the cycle type to search on.

MEMWR32 specifies Memory Read Write 32 as the cycle type to search on.

MEMWR64 specifies Memory Read Write 64 as the cycle type to search on.

MESSAGE specifies MESSAGE as the cycle type to search on.

MSGWITHDATA specifies message with Data as the cycle type to search on.

SUCCESSNODATA specifies success without data as the cycle type to search on.

SUCCESSDATA specifies success with data as the cycle type to search on.

UNSUCCESSNODATA specifies unsuccess without data as the cycle type to search on.

OOBSMBUS specifies OOB SMBus as the cycle type to search on.

MCTP specifies MCTP as the cycle type to search on.

FLASHREAD specifies FLASHREAD as the cycle type to search on.

FLASHWRITE specifies FLASHWRITE as the cycle type to search on.

FLASHERASE specifies FLASHERASE as the cycle type to search on.

FLSUCCESSNODATA specifies flash success without data as the cycle type to search on.

FLSUCCESSDATA specifies flash Success with data as the cycle type to search on.

FLUNSUCCESSNODATA specifies flash unsuccess without data as the cycle type to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CYCLETYPE MCTP specifies MCTP as the cycle type to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CYCLETYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:CYCLETYPE MCTP, indicating that MCTP is the cycle type to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:SIZE

This command specifies the length of the data string in bytes to be used for ESPI triggering if the trigger condition is DATA. The default data size is 1 byte and ranges between 1 and 5. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:SIZE?

**Arguments** <NR1> specifies the data size. The default data size is 1 and the valid range is 1 to 5.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:SIZE 4` sets the data size value as 4.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:SIZE?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:SIZE 4`, indicating that the data size value is 4.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:VALue

This command specifies the binary data string used for ESPI triggering if the trigger condition is DATA. The search number is specified by x.

**Conditions**     Requires option SR-ESPI.

**Group**            Search and Mark

**Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:DATA:VALue?`

**Arguments**      <QString> is the identifier value. The default value is XXXXXXXX.

**Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:VALue "0111100111"` sets the data value as "0111100111".

`SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:VALue?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:DATA:VALue "0111100111"`, indicating that the data value is "0111100111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:ERRor:TYPE

This command sets or queries the error type on command or response in ESPI bus. The search number is specified by x.

**Conditions**      Requires option SR-ESPI.

**Group**            Search and Mark

**Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:ERRor:TYPE {CRC| DEFer| FATA1| NONFATA1| NORESPonse| CMDOPCODE| CYCLETYPE}`

`SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:ERRor:TYPE?`

**Arguments** CRC specifies CRC as the error type to search on.  
 DEFer specifies DEFer as the error type to search on.  
 FATA1 specifies FATal as the error type to search on.  
 NONFATA1 specifies NONFATal as the error type to search on.  
 NORESPonse specifies NORESPonse as the error type to search on.  
 CMDOPCODE specifies CMDOPCODE as the error type to search on.  
 CYCLETYPE specifies CYCLETYPE as the error type to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:ERROR:TYPE CRC specifies CRC as the error type to search on.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:ERROR:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:ERROR:TYPE CRC, indicating that CRC is the error type to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:LENGth:VALue

This command specifies the binary data string used for ESPI triggering if the trigger condition is Length. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:LENGth:VALue <QString>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:LENGth:VALue?

**Arguments** <QString> is the identifier value. The default value is XXXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:LENGth:VALue "011110110101" sets the tag value as "011110110101".  
 SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:LENGth:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:LENGth:VALue "011110110101", indicating that the tag value is "011110110101".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:PHASe

This command sets or queries the phase in ESPI bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:RESPCYCLE:TYPE

This command sets or queries the response cycle type on command in ESPI bus. The search number is specified by x.

|                   |                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ESPI.                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                            |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:RESPCYCLE:TYPE {MEMRDWR32 MEMRDWR64 MESSAgE MSGWITHDATA SUCCESSNODATa SUCCESSDATa UNSUCCESSNODATa LTR FLASHREAD FLASHWRITE FLASHERASe} |

SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:RESPCYCLE:TYPE?

- Arguments**
- MEMRDWR32 specifies Memory Read/Write 32 as the cycle type to search on.
  - MEMRDWR64 specifies Memory Read/Write 64 as the cycle type to search on.
  - MESSAge specifies message as the cycle type to search on.
  - MSGWITHDATA specifies message with Data as the cycle type to search on.
  - SUCCESSNODATA specifies success without data as the cycle type to search on.
  - SUCCESSDATA specifies success with data as the cycle type to search on.
  - UNSUCCESSNODATA specifies unsuccess without data as the cycle type to search on.
  - LTR specifies LTR as the cycle type to search on.
  - FLASHREAD specifies flash read as the cycle type to search on.
  - FLASHWRITE specifies flash write as the cycle type to search on.
  - FLASHERASE specifies flash erase as the cycle type to search on.

- Examples**
- SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:RESPCYCLE:TYPE LTR specifies LTR as the cycle type to search on.
- SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:RESPCYCLE:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:RESPCYCLE:TYPE LTR, indicating that LTR is the cycle type to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:SMBUS:DESTination:ADDRESS

This command specifies the binary data string used for ESPI triggering if the trigger condition is SMBus Source/Destination Address. The search number is specified by x.

- Conditions** Requires option SR-ESPI.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:SMBUS:DESTination:ADDRESS <Qstring>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:SMBUS:DESTination:ADDRESS?

- Arguments** <QString> is the identifier value. The default value is XXXXXXXX.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:DESTINATION:ADDRESS "01111011" sets the tag value as "01111011".
- SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:DESTINATION:ADDRESS? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:DESTINATION:ADDRESS "01111011", indicating that the tag value is "01111011".

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS

This command specifies the binary data string used for ESPI triggering if the trigger condition is SMBus Slave Address. The search number is specified by x.

- Conditions** Requires option SR-ESPI.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS <QString>  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS?
- Arguments** <QString> is the identifier value. The default value is XXXXXXXX.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS "01111011" sets the tag value as "01111011".
- SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:SMBUS:SLAVE:ADDRESS "01111011", indicating that the tag value is "01111011".

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ESPI:TAG:VALUE

This command specifies the binary data string used for ESPI triggering if the trigger condition is Tag. The search number is specified by x.

- Conditions** Requires option SR-ESPI.
- Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:TAG:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:TAG:VALue?

**Arguments** <QString> is the identifier value. The default value is XXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:TAG:VALue "0111" sets the tag value as "0111".  
SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:TAG:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:TAG:VALue "0111", indicating that the tag value is "0111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue

This command specifies the binary data string used for ESPI triggering if the trigger condition is Virtual wire count. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue?

**Arguments** <QString> is the identifier value. The default value is XXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue "01111011" sets the tag value as "01111011".  
SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:VIRTUALWIRE:COUNT:VALue "01111011", indicating that the tag value is "01111011".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:DATA:VALue

This command specifies the binary data string used for ESPI triggering if the trigger condition is Virtual wire Data. The search number is specified by x.

**Conditions** Requires option SR-ESPI.

|                  |                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:STATus:VALue

This command specifies the binary data string used for ESPI triggering if the trigger condition is Virtual wire Status. The search number is specified by x.

|                   |                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ESPI.                                                                                                                |
| <b>Group</b>      | Search and Mark                                                                                                                         |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:STATus:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ESPI:VIRTUALWIRE:STATus:VALue? |
| <b>Arguments</b>  | <QString> is the identifier value. The default value is XXXXXXXXXXXXXXXXXXXX.                                                           |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:STATUS:VALUE`  
`"0111101110101010"` sets the tag value as `"0111101110101010"`.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:STATUS:VALUE?` might  
return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ESPI:STATUS:VALUE`  
`"0111101110101010"`, indicating that the tag value is `"0111101110101010"`.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ADDRESSMODE**

This command sets or queries the Address Mode in EtherCAT bus. The search number is specified by x.

**Conditions**     Requires option SR-ETHERCAT.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ADDRESSMODE`  
`{DEViCe|LOGiCaL}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ADDRESSMODE?`

**Arguments**     `DEViCe` sets the Address Mode to Device. This is the default value.  
`LOGiCaL` sets the Address Mode to Logical.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ADDRESSMODE LOGiCaL` sets  
the Address Mode to Logical.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ADDRESSMODE?` might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ADDRESSMODE LOGiCaL`,  
indicating the Address Mode is Logical.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CNTNV:VALue**

This command sets the binary Network Variable Count to be used for EtherCAT bus. The search number is specified by x.

**Conditions**     Requires option SR-ETHERCAT.

**Group**     Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CNtNV:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CNtNV:VALue?

**Arguments** <QString> is the binary Network Variable Count to be used when searching on an EtherCAT bus signal. The default size and value of Network Variable Count is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CNtNV:VALue  
"1100110011001100" sets the Network Variable Count value as  
"1100110011001100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CNtNV:VALue? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CNtNV:VALue  
"1100110011001100", indicating the Network Variable Count value is  
"1100110011001100".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:COMMANDTYPE

This command sets or queries the Command Type in EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:COMMANDTYPE {NOP|  
APRD| APWR| APRW| FPRD| FPWR| FPRW| BRD| BWR| BRW| LRD| LWR|  
LRW| ARMW| FRMW| REServed}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:COMMANDTYPE?

**Arguments** NOP specifies the Command Type and sets it to NOP. This is the default value.

APRD specifies the Command Type and sets it to APRD.

APWR specifies the Command Type and sets it to APWR.

APRW specifies the Command Type and sets it to APRW.

FPRD specifies the Command Type and sets it to FPRD.

FPWR specifies the Command Type and sets it to FPWR.

FPRW specifies the Command Type and sets it to FPRW.

BRD specifies the Command Type and sets it to BRD.

BWR specifies the Command Type and sets it to BWR.  
 BRW specifies the Command Type and sets it to BRW.  
 LRD specifies the Command Type and sets it to LRD.  
 LWR specifies the Command Type and sets it to LWR.  
 LRW specifies the Command Type and sets it to LRW.  
 ARMW specifies the Command Type and sets it to ARMW.  
 FRMW specifies the Command Type and sets it to FRMW.  
 REServed specifies the Command Type and sets it to REServed.

**Examples**      SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:COMMANDTYPE APRD  
 specifies the Command Type and sets it to APRD.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:COMMANDTYPE? might return  
 :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:COMMANDTYPE APRD,  
 indicating the Command Type is APRD.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CONDition

This command sets or queries the trigger condition for a EtherCAT bus. The search number is specified by x.

**Conditions**      Requires option SR-ETHERCAT.

**Group**            Search and Mark

**Syntax**            SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CONDition  
 {SOF| PROToCol| IPHEADer| UDPIPHEADer| MACADDRess| TCI|  
 ECATHEADERLENGTh| DATagram| NETWORKVARIable| MAILBOX|  
 FCSERRor| EOF}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:CONDition?

**Arguments**        SOF specifies the field within a EtherCAT frame to search on as SOF. This is  
 the default value.

PROToCol specifies the field within a EtherCAT frame to search on as PROToCol.

IPHEADer specifies the field within a EtherCAT frame to search on as IPHEADer.

UDPIPHEADer specifies the field within a EtherCAT frame to search on as  
 UDPIPHEADer.

MACADDRESS specifies the field within a EtherCAT frame to search on as MACADDRESS.

TCI specifies the field within a EtherCAT frame to search on as TCI.

ECATHEADERLENGTH specifies the field within a EtherCAT frame to search on as ECATHEADERLENGTH.

DATAGRAM specifies the field within a EtherCAT frame to search on as DATAGRAM.

NETWORKVARIABLE specifies the field within a EtherCAT frame to search on as NETWORKVARIABLE.

MAILBOX specifies the field within a EtherCAT frame to search on as MAILBOX.

FCSERROR specifies the field within a EtherCAT frame to search on as FCSERROR.

EOF specifies the field within a EtherCAT frame to search on as EOF.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CONDITION TCI specifies TCI as the field within a EtherCAT frame to search on.  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CONDITION? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CONDITION TCI, indicating TCI is the currently specified field within a EtherCAT frame to search on.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:CYC:VALUE

This command sets the binary Cycle Number to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:CYC:VALUE <QString>  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:CYC:VALUE?

**Arguments** <QString> is the binary Cycle Number to be used when searching on an EtherCAT bus signal. The default size and value of Network Variable Count is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CYC:VALUE "1100110011001100" sets the Cycle Number value as "1100110011001100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CYC:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:CYC:VALue "1100110011001100", indicating the Cycle Number value is "1100110011001100".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:SIZE

This command specifies the length of the data string in bytes to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:SIZE?                                                                                                                                  |
| <b>Arguments</b>  | <NR1> is the binary data value to be used when searching on an Ethernet bus signal. The default size is 1. The valid range is 1 to 5.                                                                                                          |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:SIZE 4 sets the data size value as 4.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:SIZE 4, indicating the data size value is 4. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:VALue

This command specifies the binary data string used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATA:VALue? |

|                  |                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <QString> is the binary Cycle Number to be used when searching on an EtherCAT bus signal. The default data size and value is 8 bits and "XXXXXXXX" respectively.                                                                                                            |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:VALue "00001111" sets the data value to "00001111".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATA:VALue "00001111", indicating the data value is "00001111". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAM

This command sets or queries the Datagram fields in EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                           |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAM {HEAdEr DATA WKC}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAM?                                                                                                                                                |
| <b>Arguments</b>  | HEAdEr specifies the Datagram field and sets it to Header. This is the default value.<br><br>DATA specifies the Datagram field and sets it to Data.<br><br>WKC specifies the Datagram field and sets it to WKC.                                                        |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAMHEADer:LENGth

This command sets the binary Datagram length information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                 |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                              |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAMHEADer:<br>LENGth <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DATAGRAMHEADer:<br>LENGth?                                                            |
| <b>Arguments</b>  | <QString> is the binary Datagram length information to be used when searching on an EtherCAT bus signal. The default size and value Datagram length information is 11 bits and "XXXXXXXXX XXX" respectively. |

**Examples**     SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATAGRAMHEAder:LENGth  
 "11001100110" sets the data value to "11001100110".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATAGRAMHEAder:LENGth?  
 might return  
 :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DATAGRAMHEAder:LENGth  
 "11001100110", indicating the data value is "11001100110".

## SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:DESTINATIONADDRess:VALue

This command sets the binary MAC destination address value to be used for EtherCAT bus. The search number is specified by x.

**Conditions**     Requires option SR-ETHERCAT.

**Group**            Search and Mark

**Syntax**          SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:DESTINATIONADDRess:  
 VALue <QString>  
 SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:DESTINATIONADDRess:  
 VALue?

**Arguments**      <QString> is the binary MAC destination address value to be used when searching on an EtherCAT bus signal. The default size and value of MAC Destination Address is 48 bits and "XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX" respectively.

**Examples**        SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DESTINATIONADDRess:VALue  
 "100000001000000010000000100000001000000010000000"  
 sets the MAC destination address value to  
 "100000001000000010000000100000001000000010000000".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DESTINATIONADDRess:VALue?  
 might return  
 :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DESTINATIONADDRess:VALue  
 "100000001000000010000000100000001000000010000000",  
 indicating the MAC destination address value is  
 "100000001000000010000000100000001000000010000000".

## SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:DEVICEADDRess

This command sets or queries the Device Address in EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DEVICEADDRESS<br>{POSITION OFFSet}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:DEVICEADDRESS?                                                                                                                                                  |
| <b>Arguments</b>  | POSITION specifies the Device Address to position. This is the default value.<br>OFFSet specifies the Device Address to offset.                                                                                                                                                       |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DEVICEADDRESS OFFSet<br>sets the Device Address to offset.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DEVICEADDRESS? might<br>return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:DEVICEADDRESS<br>OFFSet, indicating the Device Address is offset. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ERRor:REPLy:SERVice:DATA

This command sets or queries the error reply service data fields in EtherCAT bus.  
The search number is specified by x.

|                   |                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                 |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                              |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ERRor:REPLy:SERVice:<br>DATA {TYPE DETAil}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:ERRor:REPLy:SERVice:<br>DATA?                                                  |
| <b>Arguments</b>  | TYPE specifies the Error Reply Service Data to type. This is the default value.<br>DETAil specifies the Error Reply Service Data to detail.                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ERRor:REPLy:SERVice:DATA<br>DETAil sets the Error Reply Service Data to detail.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ERRor:REPLy:SERVice:DATA?<br>might return |

:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:ERROR:REPLY:SERVICE:DATA  
DETAIL, indicating the Error Reply Service Data is detail.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE

This command sets or queries the Frame Type in EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE<br>{BASIC UDPIP}<br>SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE?                                                                                                                                                       |
| <b>Arguments</b>  | BASIC specifies the Frame Type as BASIC. This is the default value.<br>UDPIP specifies the Frame Type as UDPIP.                                                                                                                                                                |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE UDPIP specifies<br>the Frame Type and sets it to UDPIP.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE? might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:FRAMETYPE UDPIP,<br>indicating the Frame Type is UDPIP. |

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:HASH:VALUE

This command sets the binary HASH to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:HASH:VALUE <QString><br>SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:HASH:VALUE? |

**Arguments** <QString> is the binary Hash value to be used when searching on an EtherCAT bus signal. The default size and value of Hash is 16 bits and "XXXXXXXXXXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HASH:VALue  
"1100110011001100" sets the Hash value to "1100110011001100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HASH:VALue? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HASH:VALue  
"1100110011001100", indicating the Hash value is "1100110011001100".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:HEADer:LENGth

This command sets or queries the binary header length to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:HEADer:LENGth  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:HEADer:LENGth?

**Arguments** <QString> is the binary header length to be used when searching on an EtherCAT bus signal. The default size and value of Length is 11 bits and "XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HEADer:LENGth  
"00011100" specifies the binary Length to be used for EtherCAT triggering if the trigger condition is EtherCAT Header Length and sets it to "XXX00011100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HEADer:LENGth? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:HEADer:LENGth  
"00011100", indicating the value of the Length is "XXX00011100".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IDENtification:VALue

This command sets the IP Identification to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Arguments</b>  | <QString> is the binary IP Identification to be used when searching on an EtherCAT bus signal. The default size and value of Identification is 16 bits and "XXXXXXXX XXXXXXXX" respectively.                                                                                                                                                                                                                                                             |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDENtification:VALue "0101101001011010" specifies the binary Identification to be used for EtherCAT triggering if the trigger condition is IP Header and sets it to "0101101001011010".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDENtification:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDENtification:VALue "0101101001011010", indicating the Identification value is "0101101001011010". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IDX:VALue

This command sets the binary Indexing information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IDX:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IDX:VALue?                                                   |
| <b>Arguments</b>  | <QString> is the binary Index value to be used when searching on an EtherCAT bus signal. The default size and value of Index is 8 bits and "XXXXXXXX" respectively. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDX:VALue "00010001"`  
 sets the Index value as "00010001".

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDX:VALue?` might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IDX:VALue "00010001"`,  
 indicating the Index value is "00010001".

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:INDex:VALue**

This command sets the binary Index to be used for EtherCAT bus. The search number is specified by x.

**Conditions**     Requires option SR-ETHERCAT.

**Group**            Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:INDex:VALue`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:INDex:VALue?`

**Arguments**       `<QString>` is the binary Index to be used when searching on an EtherCAT bus signal. The default size and value of Index is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples**            `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:INDex:VALue`  
`"1100110011001100"` sets the Index value as "1100110011001100".

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:INDex:VALue?` might  
 return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:INDex:VALue`  
`"1100110011001100"`, indicating the Index value is "1100110011001100".

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPDESTination:ADDRess:VALue**

This command sets the Destination IP Address to be used for EtherCAT bus. The search number is specified by x.

**Conditions**       Requires option SR-ETHERCAT.

**Group**            Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPDESTination:ADDRESS:VALUE <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPDESTination:ADDRESS:VALUE?

**Arguments** <QString> is the binary Destination IP Address to be used when searching on an EtherCAT bus signal. The default size and value of Destination Address is 32 bits and "XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX"

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPDESTination:ADDRESS:VALUE "01011010010110100101101001011010" specifies the binary Destination IP Address to be used for EtherCAT triggering if the trigger condition is IP Header and sets it to "01011010010110100101101001011010".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPDESTination:ADDRESS:VALUE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPDESTination:ADDRESS:VALUE "01011010010110100101101001011010", indicating the Destination IP Address value is "01011010010110100101101001011010".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPSOURce:ADDRESS:VALUE

This command sets the Source IP Address to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPSOURce:ADDRESS:VALUE <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IPSOURce:ADDRESS:VALUE?

**Arguments** <QString> is the binary Source IP Address to be used when searching on an EtherCAT bus signal. The default size and value of Source Address is 32 bits and "XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX"

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPSOURce:ADDRESS:VALUE "01011010010110100101101001011010" specifies the binary Source IP Address to be used for EtherCAT triggering if the trigger condition is IP Header and sets it to "01011010010110100101101001011010".

```
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPSource:ADDRESS:VALUE?
might return
:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IPSource:ADDRESS:VALUE
"01011010010110100101101001011010", indicating the Souce IP Address is
"01011010010110100101101001011010".
```

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IRQ:VALue

This command sets the binary interrupt request information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IRQ:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:IRQ:VALue?                                                                                                                                                                                                                                                         |
| <b>Arguments</b>  | <QString> is the binary interrupt request information to be used when searching on an EtherCAT bus signal. The default size and value interrupt request information is 16 bits and "XXXXXXXX XXXXXXXX" respectively.                                                                                                                                                      |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IRQ:VALue<br>"1100110011001100" sets the interrupt request information value as<br>"1100110011001100".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IRQ:VALue? might<br>return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:IRQ:VALue<br>"1100110011001100", indicating the interrupt request information value is<br>"1100110011001100". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LEN:VALue

This command sets the binary Length to be used for EtherCAT bus. The search number is specified by x.

|                   |                              |
|-------------------|------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT. |
| <b>Group</b>      | Search and Mark              |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LEN:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LEN:VALue?

**Arguments** <QString> is the binary Length to be used when searching on an EtherCAT bus signal. The default size and value of Length is 16 bits and "XXXXXXXXXXXXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LEN:VALue  
"1100110011001100" sets the Length value as "1100110011001100".  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LEN:VALue? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LEN:VALue  
"1100110011001100", indicating the Length value is "1100110011001100".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LOGICALADDRess:VALue

This command sets the binary logical address information to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LOGICALADDRess:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:LOGICALADDRess:  
VALue?

**Arguments** <QString> is the binary Logical Address to be used when searching on an EtherCAT bus signal. The default size and value Logical Address is 32 bits and "XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LOGICALADDRess:VALue  
"110011001100110011001100110011001100110011001100" sets the Logical Address value as  
"110011001100110011001100110011001100110011001100".  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LOGICALADDRess:VALue?  
might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:LOGICALADDRess:VALue  
"110011001100110011001100110011001100110011001100", indicating the Logical Address  
value is "110011001100110011001100110011001100110011001100".

**SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:MAILbox**

This command sets or queries the Mailbox fields in EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                                                 |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                              |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:MAILBOXTYPE FIVE` sets the Mailbox Type as FIVE.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:MAILBOXTYPE?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:MAILBOXTYPE FIVE`, indicating the Mailbox Type is FIVE.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiable

This command sets or queries the Network Variable fields in EtherCAT bus. The search number is specified by x.

**Conditions**     Requires option SR-ETHERCAT.

**Group**           Search and Mark

**Syntax**          `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiable`  
                          `{PUBHEADer|NVHEADer|NVDATa}`  
                          `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiable?`

**Arguments**      `PUBHEADer` specifies the Network Variable as `PUBHEADer`. This is the default value.

`NVHEADer` specifies the Network Variable as `NVHEADer`.

`NVDATa` specifies the Network Variable as `NVDATa`.

**Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiable`  
                          `NVHEADer` sets the Network Variable to NV Header.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiable?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiable` `NVHEADer`, indicating the Network Variable is NV Header.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiable:HEADer

This command sets or queries the Network Variable Header fields in EtherCAT bus. The search number is specified by x.

**Conditions**      Requires option SR-ETHERCAT.

**Group**           Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiablE:HEADer {INDEX|HASH|NVLEN|Q}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWork:VARiablE:HEADer?

**Arguments** INDEX specifies the Network Variable Header field as INDEX. This is the default value.  
HASH specifies the Network Variable Header field as HASH.  
NVLEN specifies the Network Variable Header field as NVLEN.  
Q specifies the Network Variable Header field as Q.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiablE:HEADer NVLEN sets the Network Variable Header field as NVLEN.  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiablE:HEADer? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWork:VARiablE:HEADer NVLEN, indicating the Network Variable Header field as NVLEN.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWORKVARiablE:DATA:SIZE

This command specifies the length of the network variable data string in bytes to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWORKVARiablE:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:NETWORKVARiablE:DATA:SIZE?

**Arguments** <NR1> is the Network Variable Data size. The default value is 1. The valid range is 1 to 5.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARiablE:DATA:SIZE 3 sets the Network Variable Data size as 3.  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARiablE:DATA:SIZE? might return

:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARIABLE:DATA:SIZE 3, indicating the Network Variable Data size is 3.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:NETWORKVARIABLE:DATA:VALUE

This command specifies the binary network variable data string used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                                                                                                     |

| <b>Arguments</b>  | <QString> is the binary network variable data value to be used when searching on an EtherCAT bus signal. The default Network Variable Data value is "XXXXXXXX".                                                                                                                                                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARIABLE:DATA:VALUE "00110011" sets the Network Variable Data value to "00110011".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARIABLE:DATA:VALUE? might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:NETWORKVARIABLE:DATA:VALUE "00110011", indicating the Network Variable Data value is "00110011". |

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:OFFSET:VALUE

This command sets the binary address offset information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                            |
| <b>Group</b>      | Search and Mark                                                                                                         |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:OFFSET:VALUE <QString><br>SEARCH:SEARCH<x>:TRIGGER:A:BUS:ETHERCAT:OFFSET:VALUE? |

**Arguments** <QString> is the binary Address Offset data value to be used when searching on an EtherCAT bus signal. The default size and value Address Offset is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:OFFSet:VALue  
"1100110011001100" sets the Address Offset value to "1100110011001100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:OFFSet:VALue? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:OFFSet:VALue  
"1100110011001100", indicating the Address Offset value is  
"1100110011001100".

## SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:POSition:VALue

This command sets the binary address position information to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:POSition:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:POSition:VALue?

**Arguments** <QString> is the binary Address Position value to be used when searching on an EtherCAT bus signal. The default size and value Address Position is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:POSition:VALue  
"1100110011001100" sets the Address Position value to "1100110011001100".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:POSition:VALue? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:POSition:VALue  
"1100110011001100", indicating the Address Position value is  
"1100110011001100".

## SEARCH:SEARCH<x>:TRIGGer:A:BUS:ETHERCAT:PROTOCOLTYPE

This command sets or queries the EtherCAT Protocol Type in EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                                                                                         |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:PROTOCOLTYPE<br>{PDU NETWORKVARIables MAILbox}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:PROTOCOLTYPE?                                                                                                                                      |
| <b>Arguments</b>  | PDU specifies the Protocol Type as PDU. This is the default value.<br><br>NETWORKVARIables specifies the Protocol Type as NETWORKVARIables.<br><br>MAILbox specifies the Protocol Type as MAILbox.                                                                                   |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SOURCEADDRESS:VALue

This command sets the binary MAC source address value to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                           |
| <b>Group</b>      | Search and Mark                                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SOURCEADDRESS:VALue<br><Qstring><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SOURCEADDRESS:VALue?               |
| <b>Arguments</b>  | <Qstring> is the binary MAC source address value to be used when searching on an EtherCAT bus signal. The default size and value of MAC Source Address |

is 48 bits and "XXXXXXXX XXXXXXXX XXXXXXXX XXXXXXXX  
XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SOURCEADDRESS:VALUE  
"100000001000000010000000100000001000000010000000"  
specifies the binary MAC source address value used for EtherCAT  
triggering if the trigger condition is MACADDRESS and sets it to  
"100000001000000010000000100000001000000010000000".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SOURCEADDRESS:VALUE?  
might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SOURCEADDRESS:VALUE  
"100000001000000010000000100000001000000010000000",  
indicating the MAC source address value is  
"100000001000000010000000100000001000000010000000".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SRC:PORT:VALue

This command sets the UDP Source port to be used for EtherCAT bus. The search number is specified by x.

**Conditions** Requires option SR-ETHERCAT.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SRC:PORT:VALUE  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:SRC:PORT:VALUE?

**Arguments** <QString> is the binary Source Port value to be used when searching on an EtherCAT bus signal. The default size and value of Source Port is 16 bits and "XXXXXXXX XXXXXXXX" respectively.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SRC:PORT:VALUE  
"0101101001011010" specifies the binary Source Port to be used for  
EtherCAT triggering if the trigger condition is UDP Header and sets it to  
"0101101001011010".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SRC:PORT:VALUE? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:SRC:PORT:VALUE  
"0101101001011010", indicating the Source Port value is "0101101001011010".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:TCI:VALue

This command sets the binary Tag control Information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Arguments</b>  | <QString> is the binary TCI value to be used when searching on an EtherCAT bus signal. The default size and value of TCI is 16 bits and "XXXXXXXXXXXXXXXX" respectively.                                                                                                                                                                                                                |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:TCI:VALue "11010010" specifies the binary Tag control Information used for EtherCAT triggering if the trigger condition is TCI and sets it to "XXXXXXXX1010010".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:TCI:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:TCI:VALue "11010010", indicating the TCI value is "XXXXXXXX1010010". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:WKC:VALue

This command sets the binary Working Counter information to be used for EtherCAT bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-ETHERCAT.                                                                                                                                                                                             |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                          |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:WKC:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERCAT:WKC:VALue?                                                                                                        |
| <b>Arguments</b>  | <QString> is the binary Working Counter information value to be used when searching on an EtherCAT bus signal. The default size and value of Working Counter information is 16 bits and "XXXXXXXXXXXXXXXX" respectively. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:WKC:VALue`  
`"1100110011001100"` sets the Working Counter information value as  
`"1100110011001100"`.

`SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:WKC:VALue?` might  
return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERCAT:WKC:VALue`  
`"1100110011001100"`, indicating the Working Counter information value is  
`"1100110011001100"`.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition

This command specifies a field or condition for an Ethernet bus to search on.  
The search number is specified by x.

**Conditions**     Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition`  
`{SFD|MACADDRESS|MACLENGth|IPHeader|TCPHeader|DATA|EOP|`  
`IDLe|FCSError|QTAG}`

`SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition?`

**Related Commands**     Most of the other `TRIGger:A:BUS:B<x>:ETHERnet` commands are impacted by the setting of this command.

**Arguments**     `SFD` – Start of frame delimiter.  
`MACADDRESS` – MAC addresses field.  
`MACLENGth` – MAC length/type field.  
`IPHeader` – IP header field.  
`TCPHeader` – TCP header field.  
`DATA` – TCP/IPv4 or MAC protocol client data field.  
`EOP` – End of Packet field.  
`IDLe` – Idle field.  
`FCSError` – Frame Check Sequence Error (CRC) field.  
`QTAG` – IEEE 802.1Q (VLAN) control information field.

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:CONDITION MACADDRESS` specifies MACADDRESS as the field within an Ethernet frame to search on.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:CONDITION?` might return DATA, indicating that DATA is the currently specified field within an Ethernet frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:HIVALue**

This command sets or queries the binary data value to be used when searching on an Ethernet bus signal. The search condition must be set to DATA and the data qualifier to inside or outside range. The search number is specified by x.

- Conditions**     Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.
- Group**             Search and Mark
- Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:HIVALue`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:HIVALue?`
- Arguments**        `<QString>` is the binary data value to be used when searching on an Ethernet bus signal.
- Examples**           `SEARCH:SEARCH1:TRIGger:A:BUS:ETHERnet:DATA:HIVALue "101011"` sets the data HIVALue to 101011.
- `SEARCH:SEARCH1:TRIGger:A:BUS:ETHERnet:DATA:HIVALue?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:HIVALUE "10101"`.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:OFFSet**

This command specifies the data offset value, in bytes, to use when searching on the Ethernet data field. The search condition needs to be set to DATA. The search number is specified by x.

- Conditions**        Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:OFFSet <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:OFFSet?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:VALue](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE](#)

**Arguments** <NR1> is an integer whose minimum and default values are -1 (don't care) and maximum is 1,499.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:OFFSET 36 sets the data offset to 36 bytes.  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:OFFSET? might return -1, indicating that the data offset value is the default value, -1, meaning "don't care".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:QUALifier

This command specifies the qualifier to be used when searching on an Ethernet bus signal. The search condition must be set to DATA. The search number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:QUALifier  
{LESSthan|MOREthan|EQual|UNEQual|LESSEQual|MOREEQual|INrange|OUTrange}  
  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:QUALifier?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments**

- LESSthan sets the qualifier to less than.
- MOREthan sets the qualifier to greater than.
- EQua1 sets the qualifier to equal.
- UNEQua1 sets the qualifier to not equal.
- LESSEQua1 sets the qualifier to less than or equal.
- MOREEQua1 sets the qualifier to greater than or equal.
- INrange sets the qualifier to in range.
- OUTrange sets the qualifier to out of range.

**Examples**

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:QUALIFIER  
LESSTHAN sets the qualifier to "less than".

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:QUALIFIER? might  
return SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:QUALIFIER  
EQUAL indicating that the qualifier is set to EQUAL.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE

This command specifies the length of the data string, in bytes, to use when searching on the Ethernet bus signal. The search condition needs to be set to DATA. The search number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <NR1> specifies the length of the data string, in bytes. The minimum and default values are 1, and the maximum value is 16.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:SIZE 4 specifies 4 as the number of contiguous TCP/IPV4/MAC client bytes to use when searching on the Ethernet data field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:SIZE? might return 6, indicating that 6 is the currently specified number of contiguous TCP/IPv4/MAC client bytes to use when searching on the Ethernet data field.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:VALue

This command specifies the binary value to use when searching on the Ethernet bus signal. The search condition needs to be set to DATA. The search number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:OFFSet](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE](#)

**Arguments** <QString> is a quoted string where the allowable characters are 0, 1, and X. The allowable number of characters depends on the setting for size (using [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:DATA:SIZE](#)). The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:VALUE "00001000" specifies 00001000 as the value to use when triggering on the Ethernet binary data field, assuming that TRIGGER:A:BUS:ETHERNET:DATA:SIZE is set to 1 byte.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:DATA:VALUE? might return "00001000", indicating 00001000 is the currently specified value used when searching on the Ethernet binary data field.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:DESTInationaddr:VALue

This command specifies the binary destination address value to use when searching on an Ethernet bus signal. The search condition needs to be set to `IPHeader`. The search number is specified by `x`.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:  
DESTInationaddr:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:  
DESTInationaddr:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:  
DESTINATIONADDR:VALUE "11000000101010000000000000000001"  
specifies 192.168.0.1 as the value to use when searching on the Ethernet IPv4 header address destination field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:  
DESTINATIONADDR:VALUE? might return  
"11000000101010000000000000000001", indicating that 192.168.0.1 is the currently specified value used when searching on the Ethernet IPv4 header address destination field.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:PROTOcol:VALue

This command specifies the binary protocol value to use when searching on the Ethernet bus signal. The search condition needs to be set to `IPHeader`. The search number is specified by `x`.

---

**NOTE.** Commonly used protocol values are 1 (ICMP), 2 (IGMP), 6 (TCP) and 17 (UDP).

---

|                   |                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                                                                  |
| <b>Group</b>      | Search and Mark                                                                                                                               |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:PROTOCOL:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:PROTOCOL:VALue? |

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments**     <QString> is a quoted string of up to 8 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples**     SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:PROTOCOL:VALUE "01010010" specifies 01010010 as the value to use when searching on the Ethernet IP header protocol field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:PROTOCOL:VALUE? might return "XXXXXXXX", indicating that the trigger value has been set to "don't care".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:SOURceaddr:VALue

This command specifies the binary source address value to use when searching on an Ethernet bus signal. The search condition needs to be set to IPHeader. The search number is specified by x.

|                   |                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                   |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:SOURceaddr:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:IPHeader:SOURceaddr:VALue? |

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:SOURCEADDR:VALUE "11000000101010000000000000000001" specifies to use the value of 192.168.0.1 when searching on the Ethernet IP header address source field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:IPHEADER:SOURCEADDR:VALUE might return "11000000101010000000000000000001", indicating that the search value has been set to 192.168.0.1.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRESS:DESTination:VALue

This command specifies the binary MAC address destination value to use when searching on an Ethernet bus signal. The search condition needs to be set to MACADDRESS. The search number is specified by x.

---

**NOTE.** MAC Addresses are 48-bit values such as 08:00:11:1E:C9:AE hex.

---

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRESS:DESTination:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRESS:DESTination:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 48 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:ADDRESS:DESTINATION:VALUE "XXXXXXXX001101011111100000001111010101011001000" specifies to use the value of XX:35:FC:07:AA:C8 hex when searching on the Ethernet MAC address destination field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:ADDRESS:DESTINATION:VALUE? might return "XXXXXXXX0011010111111100000001111010101011001000", indicating a MAC address destination field value of XX:35:FC:07:AA:C8 hex.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRes:SOUrce:VALue

This command specifies the binary MAC address source value to use when searching on an Ethernet bus signal. The search condition needs to be set to MACADDRESS. The search number is specified by x.

---

**NOTE.** MAC Addresses are 48-bit values such as 08:00:11:1E:C9:AE hex.

---

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRes:SOUrce:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:ADDRes:SOUrce:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 48 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:ADDRESS:SOURCE:VALUE "XXXXXXXX0011010111111100000001111010101011001000" specifies to use the value of XX:35:FC:07:AA:C8 hex when searching on the Ethernet MAC address source field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:ADDRESS:SOURCE:VALUE? might return "XXXXXXXX0011010111111100000001111010101011001000", indicating a MAC address source field value of XX:35:FC:07:AA:C8 hex.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENgth:HIVALue

This command specifies the binary MAC length high value to use when searching on an Ethernet bus signal. The search condition needs to be set to `MACADDRESS`. The search number is specified by `x`.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENgth:HIVALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENgth:HIVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 16 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:LENGTH:HIVALUE  
"XXXXXXXX00001000" specifies to use the hexadecimal value XX08 when searching on the Ethernet MAC length.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:LENGTH:HIVALUE?  
might return "XXXXXXXX00001000", indicating an Ethernet MAC length value of XX08 hex.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENgth:VALue

This command specifies the MAC length value to use when searching on an Ethernet bus signal. The search condition needs to be set to `MACADDRESS`. The search number is specified by `x`.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENGth:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:MAC:LENGth:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 16 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:LENGTH:HIVALUE "XXXXXXXX00001000" specifies to use the hexadecimal value XX08 when searching on the Ethernet MAC length.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:MAC:LENGTH:HIVALUE? might return "XXXXXXXX00001000", indicating an Ethernet MAC length value of XX08 hex.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:QTAG:VALue

This command specifies the binary Q-tag information to use when searching on an Ethernet bus signal. The search condition needs to be set to QTAG. The search number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:QTAG:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:QTAG:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:QTAG:VALUE "XXXXXXXXXXXXXXXXXXXX010010001010" specifies to use the value of hexadecimal XXXXX48A when searching on the Ethernet Q-Tag field.

SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:QTAG:VALUE? might return "XXXXXXXXXXXXXXXXXXXX010010001010", indicating that hexadecimal XXXXX48A has been set as the Ethernet Q-Tag field search value.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:TCPHeader:ACKnum:VALue

This command specifies the binary ack number value to use when searching on an Ethernet bus signal. The default is all X's (don't care). The search condition needs to be set to TCPHeader. The search number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:TCPHeader:ACKnum:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:TCPHeader:ACKnum:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:CONDition](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ETHERNET:TCPHEADER:ACKNUM:VALUE "XXXXXXXXXXXXXXXXXXXX00001000" specifies hexadecimal XXXXXX08 as the value to use when searching on the Ethernet TCP header acknowledgement number.

TRIGGER:A:BUS:ETHERNET:TCPHEADER:ACKNUM:VALUE? might return "XXXXXXXXXXXXXXXXXXXX00001000", indicating that hexadecimal XXXXXX08 has been specified as the value to use when searching on the Ethernet TCP header acknowledgement number.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ETHERnet:TCPHeader:DESTinationport:VALue

This command specifies the binary destination port value to use when searching on the Ethernet TCP header destination port number. The search condition needs to be set to TCPHeader. The search number is specified by x.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Arguments</b>  | SYNC specifies the search condition as Sync.<br><br>HANDSHAKEPacket specifies the search condition as Handshake Packet.<br><br>SPECIALPacket specifies the search condition as Special Packet.<br><br>ERRor specifies the search condition as Error.<br><br>TOKENPacket specifies the search condition as Token (Address) Packet.<br><br>DATAPacket specifies the search condition as Data Packet.<br><br>RESET specifies the search condition as Reset. |

CONNECT specifies the search condition as connect.

CONTROLMESSAGE specifies the search condition as Control Message.

SUSPEND specifies the search condition as Suspend.

DEVICEChirp specifies the search condition as Device chirp.

HOSTChirp specifies the search condition as Host Chirp.

PORTReset specifies the search condition as Port Reset.

PORTConfiguration specifies the search condition as Port Configuration.

RESUME specifies the search condition as Resume.

RAP specifies the search condition as Register Access Protocol.

EOP specifies the search condition as End of Packet.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:CONDition SYNC specifies sync as the field within a eUSB frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:CONDition? might return SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:CONDition START, indicating that START is the currently specified field within a eUSB frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:HIVALue

This command sets the high binary data value to be used when triggering on a eUSB bus signal. The trigger condition must be set to DATA. The search number is specified by x.

**Conditions** Requires option SR-EUSB2

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:HIVALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:HIVALue?

**Arguments** <QString> specifies the value in the specified valid format. The valid characters are 0, 1, and X (for binary, for hexadecimal, and symbolic).

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:HIVALue XXXXXXXX specifies high binary data value as XXXXXXXX within an eUSB frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:HIVALue? might return  
SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:HIVALue XXXXXXXX,  
indicating the high binary data value as XXXXXXXX in the currently specified  
field within an eUSB frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:OFFSet

This command sets the byte offset to look for a data pattern at, in bytes, to be used when triggering on a eUSB bus signal. The trigger condition must be set to DATA. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                                                                                                                                                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                 |

|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:QUALifier {Equal UNEQual LESSthan MOREthan LESSEQual MOREEQual Inrange OUTrange}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:QUALifier?                                                                                                                                                                                                                                                       |
| <b>Arguments</b> | Equal specifies the qualifier as Equal.<br>UNEQual specifies the qualifier as Not Equal to.<br>LESSthan specifies the qualifier as Less Than.<br>MOREthan specifies the qualifier as More Than.<br>LESSEQual specifies the qualifier as Less Than or Equal to.<br>MOREEQual specifies the qualifier as More Than or Equal to.<br>Inrange specifies the qualifier as Inside Range.<br>OUTrange specifies the qualifier as Out of Range. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:QUALifier Equal specifies trigger value as Equal.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:QUALifier? might return SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:QUALifier Equal, indicating the trigger value as Equal.                                                                                                                                                                          |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:SIZE

This command sets the length of the data string, in bytes, to be used when triggering on a eUSB bus signal. The trigger condition must be set to DATA. The search number is specified by x.

|                   |                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                   |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:SIZE?             |
| <b>Arguments</b>  | <NR1> specifies the length of the data string. Default data size value is 1. The argument range is 1 to 16 bytes. |

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:SIZE 1` specifies the data size as 1 byte within an eUSB frame to search on.

`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:SIZE?` might return `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:SIZE 1`, indicating that data size value is 1 in the currently specified field within an eUSB frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:TYPE**

This command specifies the eUSB trigger type to be valid on any, data0, data1, data2, or mdata condition. The search number is specified by x.

**Conditions**     Requires option SR-EUSB2

**Group**             Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:TYPE {ANY| DATA0| DATA1| DATA2| MDATA}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:TYPE?`

**Arguments**        ANY specifies either a DATA0 or DATA1 data packet type.  
DATA0 specifies a DATA0 data packet type.  
DATA1 specifies a DATA1 data packet type.  
DATA2 specifies a DATA2 data packet type when on HIGH speed.  
MDATA specifies a MDATA data packet type when on HIGH speed.

**Examples**        `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:TYPE DATA0` sets the data type as DATA0.  
`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:TYPE?` might return `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:DATA:TYPE DATA0`, indicating that the data type is DATA0.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATA:VALue**

This command sets the binary data value to be used when triggering on a eUSB bus signal. The trigger condition must be set to DATA. The search number is specified by x.

**Conditions**        Requires option SR-EUSB2

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:DATABITS:SIZE

This command sets the number of Sync bits, in bytes, to be used when triggering on a eUSB bus signal. The trigger condition must be set to SYNC. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ERRType

This command specifies the eUSB trigger type to be valid on a PID, Token CRC5, Data CRC16, or Bit stuffing condition. The search number is specified by x.

|                   |                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ERRType<br>{BITSTUFFing CRC5 CRC16 PID}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ERRType?           |
| <b>Arguments</b>  | BITSTUFFing specifies the error type as Bit Stuffing.<br><br>CRC5 specifies the error type as Token CRC5 (Cyclic Redundancy Check 5). |

CRC16 specifies the error type as Data CRC16 (Cyclic Redundancy Check 16).

PID specifies the error type as PID Check Bits.

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ERRType PID` specifies PID as the field within an eUSB frame to search on.

`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ERRType?` might return `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ERRType PID`, indicating that PID is the currently specified field within a eUSB frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ENDSEARCh**

This command specifies eUSB Search EOP Bits to be On and Off. The search number is specified by x.

**Conditions**     Requires option SR-EUSB2

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ENDSEARCh {OFF|ON}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:ENDSEARCh?`

**Arguments**     OFF specifies the EOP bits as OFF (for Low Speed and Full Speed).

ON specifies the EOP bits as ON (for High Speed).

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ENDSEARCh OFF` specifies the EOP bits as OFF.

`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ENDSEARCh?` might return `:SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:ENDSEARCh OFF`, indicating the EOP bits as off.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOP:DATABITS:SIZE**

This command sets the number of EOP bits, in bytes, to be used when triggering on a eUSB bus signal. The trigger condition must be set to EOP. The search number is specified by x.

**Conditions**     Requires option SR-EUSB2

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOP:QUALifier

This command sets the qualifier to be used when triggering on a eUSB bus signal. The trigger condition must be set to EOP Bits. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOP:QUALifier {Equal UNEQUAL LESSthan MOREthan LESSEQUAL MOREEQUAL INrange OUTrange}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOP:QUALifier?                                                                                                                                                                                                    |
| <b>Arguments</b>  | Equal specifies the qualifier as Equal.<br>UNEQUAL specifies the qualifier as Not Equal to.<br>LESSthan specifies the qualifier as Less Than.<br>MOREthan specifies the qualifier as More Than.<br>LESSEQUAL specifies the qualifier as Less Than or Equal to.<br>MOREEQUAL specifies the qualifier as More Than or Equal to.<br>INrange specifies the qualifier as Inside Range. |

OUTrange specifies the qualifier as Out of Range.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOP:QUALifier Equal specifies the trigger value as Equal.

SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOP:QUALifier? might return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOP:QUALifier Equal, indicating the trigger value is Equal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE

This command sets the number of EOP bits to be used when triggering on a eUSB bus signal. The trigger condition must be set to EOP. The search number is specified by x.

**Conditions** Requires option SR-EUSB2

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE?

**Arguments** <NR1> specifies the number of EOP bits. The default maximum EOP bits is 100. The argument range is 9 to 100 bits.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE 100 specifies maximum EOP bits as 100 within an eUSB frame to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE? might return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:EOPBITS:MAX:SIZE 100, indicating that maximum EOP bits value is 100 in the currently specified field within an eUSB frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:EOPBITS:MIN:SIZE

This command sets the number of EOP bits to be used when triggering on a eUSB bus signal. The trigger condition must be set to EOP. The search number is specified by x.

**Conditions** Requires option SR-EUSB2

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:HANDSHAKEType

This command specifies the eUSB trigger type to be valid on any, ack, nak, stall, or nyet condition. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Arguments</b>  | <QString> specifies the value in the specified valid format. The valid characters are 0, 1, and X for binary; for hexadecimal; and symbolic.                                                                                                                                                                                                                                     |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:ADDress:VALue XXXXXX specifies RAP address as XXXXXX within an eUSB frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:ADDress:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:ADDress:VALue XXXXXX, indicating that RAP address value XXXXXX is the currently specified field within an eUSB frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:COMManD

This command specifies the eUSB Register Access Protocol search option. The search number is specified by x.

|                   |                                                                               |
|-------------------|-------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                      |
| <b>Group</b>      | Search and Mark                                                               |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:COMManD<br>{ALL WRITE READ CLEAR SET} |

SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:COMManD?

**Arguments** ALL specifies the RAP command as All.  
 WRITe specifies the RAP command as Write.  
 READ specifies the RAP command as Read.  
 CLear specifies the RAP command as Clear.  
 SET specifies the RAP command as Set.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:COMManD ALL specifies the command as the field within an eUSB frame to search on.  
 SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:COMManD? might return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:COMManD ALL, indicating that command type is ALL.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:DATA:VALue

This command sets the binary Register Access Protocol data value to be used when triggering on a eUSB bus signal. The trigger condition must be set to TOKEN. The search number is specified by x.

**Conditions** Requires option SR-EUSB2

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:DATA:VALue <QString>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:DATA:VALue?

**Arguments** <QString> specifies the value in the specified valid format. The valid characters are 0, 1, and X for binary; for hexadecimal; and symbolic.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:DATA:VALue XXXXXXXX specifies RAP data value as XXXXXXXX within an eUSB frame to search on.  
 SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:DATA:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:RAP:DATA:VALue XXXXXXXX, indicating that RAP data value XXXXXXXX is the currently specified field within an eUSB frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:RAP:OPTion

This command specifies the eUSB Register Access Protocol search option. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                                                                                                                                                                                                      |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SOFFRAMENUMber

This command sets the binary frame number to be used when triggering on a eUSB bus signal. The trigger condition must be set to TOKEN. The search number is specified by x.

|                   |                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                            |
| <b>Group</b>      | Search and Mark                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SOFFRAMENUMber <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SOFFRAMENUMber? |
| <b>Arguments</b>  | <QString> specifies the binary frame number within the range 000 0000 0000 to 111 1111 1111 (000 hex to 7FF hex).   |

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SOFFRAMENUMber XXXXXXXXXXXX`  
specifies frame number as XXXXXXXXXXXX within an eUSB frame to search on.

`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SOFFRAMENUMber?` might return  
`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SOFFRAMENUMber XXXXXXXXXXXX`,  
indicating that XXXXXXXXXXXX in the currently specified field within an eUSB  
frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPECIALType

This command specifies the eUSB trigger type to be valid on any, err, split, ping, or reserved condition. The search number is specified by x.

**Conditions**     Requires option SR-EUSB2

**Group**             Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPECIALType {ANY|`  
`PREAmble| ERROR| SPLit| PING| RESERVed}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPECIALType?`

**Arguments**        `ANY` specifies the PID value as Any (XX00).  
`PREAmble` specifies the PID value as PRE (1100).  
`ERROR` specifies the PID value as ERR (1100).  
`SPLit` specifies the PID value as Split (1000).  
`PING` specifies the PID value as PING (0100).  
`RESERVed` specifies the PID value as Reserved (0000).

**Examples**        `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPECIALType ANY` specifies the  
special type as any.

`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPECIALType?` might return  
`SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPECIALType ANY`, indicating  
the special type is any.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:ET:VALue

This command specifies the eUSB trigger type endpoint condition. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                                                                                                                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                       |

| <b>Arguments</b>  | NOCARE specifies the Endpoint Type value as Don't Care.<br>CONTRol specifies the Endpoint Type value as Control (00).<br>ISOchronous specifies the Endpoint Type value as Isochronous (01).<br>BULK specifies the Endpoint Type value as Bulk (10).<br>INTERRUPT specifies the Endpoint Type value as Interrupt (11). |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:ET:VALue CONTRol sets<br>the endpoint condition as Control.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:ET:VALue? might return<br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:ET:VALue CONTRol,<br>indicating the endpoint condition is Control.                               |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue

This command sets the binary hub address value to be used when triggering on a eUSB bus signal. The trigger condition must be set to Special with packet type SPLIT. The search number is specified by x.

|                   |                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                                                       |
| <b>Group</b>      | Search and Mark                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue?                       |
| <b>Arguments</b>  | <QString> specifies the value in the specified valid format. The valid characters are 0, 1, and X (for binary, for hexadecimal, and symbolic). |

- Examples**      `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue XXXXXXXX` specifies hub address value as XXXXXXXX within an eUSB frame to search on.
- `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue?` might return `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:HUB:VALue XXXXXXXX`, indicating that hub address value is XXXXXXXX in the currently specified field within an eUSB frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue**

This command sets the binary port address value to be used when triggering on a eUSB bus signal. The trigger condition must be set to Special with a packet type SPLIT. The search number is specified by x.

- Conditions**      Requires option SR-EUSB2
- Group**            Search and Mark
- Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue?`
- Arguments**      `<QString>` specifies the value in the specified valid format. The valid characters are 0, 1, and X (for binary, for hexadecimal, and symbolic).
- Examples**        `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue XXXXXXXX` specifies port address as XXXXXXXX within an eUSB frame to search on.
- `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue?` might return `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SPLit:PORT:VALue XXXXXXXX`, indicating that port address value is XXXXXXXX in the currently specified field within an eUSB frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:SC:VALue**

This command specifies the eUSB trigger type start/complete condition. The search number is specified by x.

- Conditions**      Requires option SR-EUSB2
- Group**            Search and Mark

|                  |                                                                                                                                                                                                                                                                                             |

| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:SE:VALue {NOCARE FULLSPEED LOWSPEED ISOSTART ISOMID ISOEND ISOALL}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SPLit:SE:VALue?                                                                                                                                                                                                                                                                                                               |
| <b>Arguments</b>  | NOCARE sets the trigger on any combination of S and E bits.<br><br>FULLSPEED sets the trigger on S bit = 0 and E bit = 0.<br><br>LOWSPEED sets the trigger on S bit = 1 and E bit = 0.<br><br>ISOSTART sets the trigger on S bit = 1, E bit = 0.<br><br>ISOMID specifies Isochronous Data is Middle (00) Start/End bit value.<br><br>ISOEND specifies Isochronous Data is End (01) Start/End bit value.<br><br>ISOALL specifies Isochronous Data is All (11) Start/End bit value. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SPLIT:SE:VALUE FULLSPEED`  
sets the start/complete condition as fullspeed.

`SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SPLIT:SE:VALUE?` might return  
`SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SPLIT:SE:VALUE FULLSPEED`,  
indicating that the start/complete condition is fullspeed.

## **SEARCH:SEARCH<x>:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER**

This command sets the qualifier to be used when triggering on a eUSB bus signal. The trigger condition must be set to Sync Bits. The search number is specified by x.

**Conditions**     Requires option SR-EUSB2

**Group**           Search and Mark

**Syntax**         `SEARCH:SEARCH<x>:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER {EQUAL|`  
`UNEQUAL| LESSTHAN| MORETHAN| LESSEQUAL| MOREEQUAL| INRANGE|`  
`OUTRANGE}`  
`SEARCH:SEARCH<x>:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER?`

**Arguments**     `EQUAL` specifies the qualifier as Equal.  
`UNEQUAL` specifies the qualifier as Not Equal to.  
`LESSTHAN` specifies the qualifier as Less Than.  
`MORETHAN` specifies the qualifier as More Than.  
`LESSEQUAL` specifies the qualifier as Less Than or Equal to.  
`MOREEQUAL` specifies the qualifier as More Than or Equal to.  
`INRANGE` specifies the qualifier as Inside Range.  
`OUTRANGE` specifies the qualifier as Out of Range.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER EQUAL`  
specifies the trigger value as Equal.

`SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER?` might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:EUSB:SYNC:QUALIFIER EQUAL`,  
indicating the trigger value is Equal.

**SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE**

This command sets the number of sync bits, to be used when triggering on a eUSB bus signal. The trigger condition must be set to SYNC. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE?                                                                                                                                                                                                                                                                       |
| <b>Arguments</b>  | <NR1> specifies the number of sync bits. The default maximum Sync bits is 32. The argument range is 13 to 32 bits.                                                                                                                                                                                                                                                                          |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE 32<br>specifies minimum Sync bits as 32 within an eUSB frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE? might<br>return :SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MAX:SIZE 32,<br>indicating that minimum Sync bits value is 32 in the currently specified field<br>within an eUSB frame to search on. |

**SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE**

This command sets the number of sync bits, in bits, to be used when triggering on a eUSB bus signal. The trigger condition must be set to SYNC. The search number is specified by x.

|                   |                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-EUSB2                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE? |
| <b>Arguments</b>  | <NR1> specifies the number of sync bits. The default minimum Sync bits is 12. The argument range is 12 to 31 bits.    |

- Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE 12`  
specifies minimum Sync bits as 12 within an eUSB frame to search on.
- `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE?` might  
return `:SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCBITS:MIN:SIZE 12,`  
indicating that minimum Sync bits value is 12 in the currently specified field  
within an eUSB frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCSEARCH**

This command specifies eUSB Search Sync Bits to be On and Off. The search number is specified by x.

- Conditions**     Requires option SR-EUSB2
- Group**            Search and Mark
- Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCSEARCH {OFF|ON}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:SYNCSEARCH?`
- Arguments**      OFF specifies the Sync bits as OFF (for Low Speed and Full Speed).  
ON specifies the Sync bits as ON (for High Speed).
- Examples**        `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCSEARCH OFF` specifies the  
SYNC bits as off.
- `SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCSEARCH?` might return  
`:SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:SYNCSEARCH OFF,` indicating  
the SYNC bits is off.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:TOKENType**

This command specifies the eUSB trigger type to be valid on any, sof, out, in, or setup condition. The search number is specified by x.

- Conditions**      Requires option SR-EUSB2
- Group**            Search and Mark

|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:TOKENType<br>{ANY SOF OUT IN SETUP}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:EUSB:TOKENType?                                                                                                                                                                     |
| <b>Arguments</b> | ANY specifies the token type as Any (XX01).<br>SOF specifies the token type as Start Of Frame (0101).<br>OUT specifies the token type as OUT (0001).<br>IN specifies the token type as IN (1001).<br>SETUP specifies the token type as SETUP (1101).                                          |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:TOKENType SETUP specifies the token type Setup as the field within an eUSB frame to search on.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:TOKENType? might return SEARCH:SEARCH1:TRIGger:A:BUS:EUSB:TOKENType SETUP, indicating that the token type is Setup. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CONDition

This command sets or queries the FlexRay bus search condition. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CONDition {SOF FRAMEType  IDENTifier  CYCLEcount  HEADer  DATA  IDANDDATA  EOF  ERRor}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CONDition?                                                                                                                                    |
| <b>Arguments</b>  | SOF sets the trigger condition to start of frame.<br>FRAMEType sets the trigger condition to frame type.<br>IDENTifier sets the trigger condition to identifier.<br>CYCLEcount sets the trigger condition to cycle count.<br>HEADer sets the trigger condition to header.<br>DATA sets the trigger condition to data. |

IDANDDATA sets the trigger condition to ID and data.

EOF sets the trigger condition to end of frame.

ERROR sets the trigger condition to error.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CONDition SOF sets the trigger condition to start of frame.

SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CONDition? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:CONDITION SOF, indicating the FlexRay trigger condition is start of frame.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:HIVALue

This command sets or queries the height value when searching on a FlexRay bus cycle count field. The search number is specified by x. The search condition must be set to CYCLEcount.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:HIVALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:HIVALue?

**Arguments** <QString> specifies the cycle count value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CYCLEcount:HIVALue "1010" sets the cycle count value to XX1010.

SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CYCLEcount:HIVALue? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:CYCLECOUNT:HIVALUE "XXXXXX", indicating the cycle count value is don't care, and it will trigger on any cycle count.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:QUALifier

This command sets or queries the qualifier to be used when searching on a FlexRay bus search cycle count field. The search number is specified by x. The search condition must be set to CYCLEcount.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                                                                                                                                                                            |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:VALue

This command sets or queries the low value when searching on a FlexRay bus cycle count field. The search number is specified by x. The search condition must be set to CYCLEcount.

|                   |                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:CYCLEcount:VALue?                                                                                                                                                                                                         |
| <b>Arguments</b>  | <QString> specifies the cycle count value.                                                                                                                                                                                                                                                                                            |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CYCLEcount:VALue "1010" sets the cycle count value to XX1010.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:CYCLEcount:VALue? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:CYCLECOUNT:VALUE "XXXXXX", indicating the cycle count value is don't care, and it will trigger on any cycle count. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:HIVALue

This command sets or queries the high value when searching on a FlexRay bus data field. The search number is specified by x. The search condition must be set to IDANDDATA OR DATA.

|                   |                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                          |
| <b>Group</b>      | Search and Mark                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:HIVALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:HIVALue? |
| <b>Arguments</b>  | <QString> specifies the data value.                                                                                   |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:HIVALue "1010" sets the data value to XXXXXX1010.                           |

SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:HIVALue? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:DATA:HIVALUE "XXXXXXXXXX", indicating the data value is a don't care.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:OFFSet

This command sets or queries the offset of the data string, in bytes, when searching on a FlexRay bus data field. The search number is specified by x. The search condition must be set to IDANDDATA OR DATA.

|                   |                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                             |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                          |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:OFFSet <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:OFFSet?                                                                                                                                          |
| <b>Arguments</b>  | <NR3> specifies the data offset in bytes. A setting of X/Don't care is accomplished by setting the offset to -1.                                                                                                                                         |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:OFFSet 2 sets the data offset to 2 bytes.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:OFFSet? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:DATA:OFFSet -1, indicating the data offset is don't care. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:QUALifier

This command sets or queries the qualifier to be used when searching on a FlexRay bus signal. The search number is specified by x.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application. |
| <b>Group</b>      | Search and Mark                                                              |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:QUALifier  
 {EQual|LESSEQual|MOREEQual|UNEQual|LESSthan|MOREthan|INrange|OUTrange}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:QUALifier?

**Arguments** EQual specifies the qualifier as equal.  
 LESSEQual specifies the qualifier as less equal.  
 MOREEQual specifies the qualifier as more equal.  
 UNEQual specifies the qualifier as unequal.  
 LESSthan specifies the qualifier as less than.  
 MOREthan specifies the qualifier as more than.  
 INrange specifies the qualifier as in range.  
 OUTrange specifies the qualifier as out of range.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:QUALifier LESSTHAN  
 sets the data qualifier to less than.  
 SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:QUALifier? might  
 return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:DATA:QUALIFIER  
 EQUAL, indicating the data qualifier is equal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:SIZE

This command sets or queries the length of the data string, in bytes, to be used when searching on a FlexRay bus data field. The search number is specified by x. The search condition must be set to IDANDDATA OR DATA.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:SIZE <NR1>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:SIZE?

**Arguments** <NR1> specifies the data size in bytes. A data size of -1 is don't care.

- Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:SIZE 2` sets the data size to 2.
- `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:SIZE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:DATA:SIZE 1`, indicating the data size is 1 byte.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:VALue

This command sets or queries the low value to be used when searching on a FlexRay bus data field. The search number is specified by x. The search condition must be set to IDANDDATA or DATA.

- Conditions**     Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.
- Group**            Search and Mark
- Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:DATA:VALue?`
- Arguments**        <QString> specifies the data value.
- Examples**         `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:VALue "1010"` sets the data value to XXXXXX1010.
- `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:DATA:VALue?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:DATA:VALUE "XXXXXXXXXX"`, indicating the data value is a don't care.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:EOFTYPE

This command sets or queries the end of frame type when searching on a FlexRay bus signal. The search number is specified by x. The search condition must be set to EOF.

- Conditions**        Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.
- Group**            Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:EOFTYPE  
 {ANY|STATIC|DYNAMIC}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:EOFTYPE?

**Arguments** ANY specifies either end of file type.  
 STATIC specifies the static end of file type.  
 DYNAMIC specifies the static end of file type.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:EOFTYPE STATIC sets the end of file type to static.  
 SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:EOFTYPE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:EOFTYPE ANY, indicating either end of file type will cause a trigger.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:ERRTYPE

This command sets or queries the error type when searching on a FlexRay bus signal. The search number is specified by x. The search condition must be set to ERROR.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:ERRTYPE  
 {CRCHeader|CRCTrailer|NULLFRStatic|NULLFRDynamic|  
 SYNCFrame|STARTupnosync}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:ERRTYPE?

**Arguments** CRCHeader sets the error type to CRCHeader.  
 CRCTrailer sets the error type to CRCTrailer.  
 NULLFRStatic sets the error type to NULLFRStatic.  
 NULLFRDynamic sets the error type to NULLFRDynamic.  
 SYNCFrame sets the error type to SYNCFrame.  
 STARTupnosync sets the error type to STARTupnosync.

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:ERRTYPE SYNCFRAME` sets the error type to SYNCFRAME.

`SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:ERRTYPE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:ERRTYPE CRCHEADER`, indicating the error type is CRCHEADER.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:HIVALue

This command sets or queries the high value when searching on a FlexRay bus frame id field. The search condition must be set to IDentifier. The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:HIVALue`  
                   <QString>  
                   `SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:HIVALue?`

**Arguments**     <QString> is the frame id high value.

**Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:FLEXray:FRAMEID:HIVALue`  
                   "xxxxxxxx1010" sets the HIVALUE to XXXXXXXX1010.

`SEARCH:SEARCH1:TRIGger:A:BUS:FLEXray:FRAMEID:HIVALue?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:HIVALUE "XXXXXXXXXXXX"` indicating the HIVALUE is XXXXXXXXXXXX.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:QUALifier

This command sets the qualifier to be used when searching on a FlexRay bus signal. The search condition must be set to Identifier. The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:QUALifier`  
                   {Equal|UNEQual|LESSthan|MOREthan|LESSEQual|MOREEQual|  
                   INrange|OUTrange}  
                   `SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEID:QUALifier?`

**Arguments**    `EQUAL` sets the qualifier to equal.  
                  `UNEQUAL` sets the qualifier to unequal.  
                  `LESSTHAN` sets the qualifier to less than.  
                  `MORETHAN` sets the qualifier to more than.  
                  `LESSEQUAL` sets the qualifier to less equal.  
                  `MOREEQUAL` sets the qualifier to more equal.  
                  `INRANGE` sets the qualifier to in range.  
                  `OUTRANGE` sets the qualifier to out of range.

**Examples**    `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:QUALIFIER`  
                  `UNEQUAL` sets the qualifier to unequal.  
  
                  `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:QUALIFIER?` might  
                  return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:QUALIFIER`  
                  `EQUAL` indicating the qualifier is set to equal.

## **SEARCH:SEARCH<x>:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE**

This command sets the low value when searching on a FlexRay bus id field. The search condition must be set to `IDENTIFIER`. The search number is specified by `x`.

**Group**        `Search and Mark`

**Syntax**        `SEARCH:SEARCH<x>:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE`  
                  `<QString>`  
                  `SEARCH:SEARCH<x>:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE?`

**Arguments**    `<QString>` is the frame id value.

**Examples**    `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE`  
                  `"XXXXXXXX1010"` sets the value to `XXXXXXXX1010`.  
  
                  `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE?` might  
                  return `SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMEID:VALUE`  
                  `"XXXXXXXXXXXX"` indicating the value is `XXXXXXXXXXXX`.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEType

This command sets or queries the FlexRay bus search frame type. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                           |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEType<br>{NORMAL PAYload NULL SYNC STARTup}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:FRAMEType?                                                                                                            |
| <b>Arguments</b>  | NORMAL sets the frame type to normal.<br>PAYload sets the frame type to payload.<br>NULL sets the frame type to null.<br>SYNC sets the frame type to sync.<br>STARTup sets the frame type to startup.                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:FRAMEType startup sets the frame type to startup.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:FRAMEType? might return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:FRAMETYPE NORMAL, indicating the frame type is normal. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:FLEXRAY:HEADER:CRC

This command sets or queries the CRC portion of the binary header string when searching on a FlexRay bus header. The search number is specified by x.

|                   |                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                      |

| <b>Arguments</b>  | <QString> specifies the header Payload Length.                                                                                                                                                                                                                                                     |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:HEADER:PAYLEngth "1010"<br>sets the Payload Length to 1010.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:FLEXRAY:HEADER:PAYLEngth? might<br>return SEARCH:SEARCH1:TRIGGER:A:BUS:FLEXRAY:HEADER:PAYLENGTH<br>"XXXXXXX", indicating the Payload Length has not been set. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:MODe

This command sets or queries the I2C address mode for the specified bus search to determine where to place a mark. The search number is specified by x.

|                   |                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.                                          |
| <b>Group</b>      | Search and Mark                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:MODe<br>{ADDR10 ADDR7}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:MODe? |
| <b>Arguments</b>  | ADDR10 specifies the address mode as ADDR10.<br><br>ADDR7 specifies the address mode as ADDR7.                        |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:ADDRESS:MODE ADDR10` sets the address mode for I2C bus trigger search 1 to ADDR10.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I2C:ADDRESS:MODE?` might return `:SEARCH:SEARCH2:TRIGGER:A:BUS:I2C:ADDRESS:MODE ADDR7`, indicating that the address mode for I2C bus trigger search 2 is set to ADDR7.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:VALue

This command sets or queries the binary address string used for the I2C search the specified search condition is Address or AddressData. The search number is specified by x.

- Conditions**     Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.
- Group**             Search and Mark
- Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:VALue?`
- Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:ADDReSS:MODE](#)
- Arguments**        <QString> specifies the address value. This is either a 7-bit or 10-bit value depending on the address mode. The valid characters are 0-9, A-F, and X for addresses in hexadecimal format; and 0, 1, and X otherwise.
- Examples**            `SEARCH:SEARCH2:TRIGGER:A:BUS:I2C:ADDRESS:VALUE "01XXXXX"` sets the address value to "01XXXXX" when the mode is ADDR7 and the format is binary.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:ADDRESS:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:ADDRESS:VALUE "XX"`, indicating that the address value is "XX" when the address mode is set to ADDR7 and the address format is hexadecimal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:CONDition

This command sets or queries the search condition for an I2C bus. The search number is specified by x.

| <b>Arguments</b>  | <p>ADDRESS specifies the trigger condition as Address.</p> <p>ADDRANDDATA specifies the trigger condition as Address and Data.</p> <p>DATA specifies the trigger condition as Data.</p> <p>ACKMISS specifies the trigger condition as Missing of Acknowledgement.</p> <p>REPEATstart specifies the trigger condition as Repeat of Start.</p> <p>START specifies the trigger condition as Start.</p> <p>STOP specifies the trigger condition as Stop.</p> |
| <b>Examples</b>   | <p>SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:CONDITION ADDRESS sets the trigger condition for I2C bus trigger search 1 to Address.</p> <p>SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:CONDITION? might return SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:CONDITION ADDRANDDATA, indicating that the trigger condition for I2C bus trigger search 1 is set to Address and Data.</p>                                                                                                     |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:DATA:DIRection

This command sets or queries the direction of the data for the I2C bus search to determine where to place a mark. The search number is specified by x. Read or write is indicated by the R/W bit in the I2C protocol.

|                   |                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.                                                |

| <b>Conditions</b> | Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.                                                                                                                                                                                                                                                |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I2C:DATA:VALue?                                                                                                                                                                                                                   |
| <b>Arguments</b>  | <QString> specifies the data value. The valid characters are 0, 1, or X for binary format; and A-F, 0-9, and X for hexadecimal format.                                                                                                                                                                                      |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:I2C:DATA:VALUE "1001" sets the data value for I2C bus trigger search 1 to "1001".<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I2C:DATA:VALUE? might return :SEARCH:SEARCH2:TRIGGER:A:BUS:I2C:DATA:VALUE "XX", indicating that the data value for I2C bus trigger search is "XX" in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRess:MODE

This command sets or queries the address mode for the specified I3C bus trigger search to determine where to place a search mark.

Requires purchase and installation of option SRI3C.

|                         |                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>            | Search and Mark                                                                                                                              |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRess:MODE<br>{ADDR10 ADDR7}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRess:MODE?                        |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:I3C:ADDRess:VALue</a>                                                                       |
| <b>Arguments</b>        | SEARCH<x> specifies the search number.<br><br>ADDR10 specifies the address mode as ADDR10.<br><br>ADDR7 specifies the address mode as ADDR7. |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:ADDRESS:MODE ADDR10` sets the address mode for I3C bus trigger Search 1 to ADDR10.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:ADDRESS:MODE?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:ADDRESS:MODE ADDR7`, indicating that the address mode for I3C bus trigger Search 2 is set to ADDR7.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRes:VALue

This command sets or queries the I3C address value for which to search, to determine where to place a search mark.

Requires purchase and installation of option SRI3C.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRes:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRes:VALue?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ADDRes:MODE](#)

**Arguments**     `SEARCH<x>` specifies the search number.

`<QString>` specifies the address value for the specified Search `<x>`. This is either a 7-bit or 10-bit value depending on the address mode. The valid characters are 0-9, A-F, and X for Hexadecimal address format; and 0, 1, and X (don't care) for Binary address format.

- Examples**     `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:ADDRESS:VALUE "01XXXXX"` sets the address value to "01XXXXX" when the mode is ADDR7 and the format is binary.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:ADDRESS:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:ADDRESS:VALUE "XX"`, indicating that the address value is "XX" when the address mode is set to ADDR7 and the address format is hexadecimal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:BCR:VALue

This command sets or queries the binary field string used for the I3C search if the trigger condition is BCR.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:BCR:VALUE <QString><br>SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:BCR:VALUE?                                                                                                                                                                                                    |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.                                                                                                        |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:BCR:VALUE "1001" sets the BCR value for I3C bus Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BCR:VALUE? might return<br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BCR:VALUE "1001", indicating that the BCR value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:BCRType:VALUE

This command sets or queries the binary field string used for the I3C bus search if the trigger condition is BCRTYPE.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                                      |

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:BCRType:VALUE "1001" sets the DCR Type value for I3C bus Search 1 to "1001".<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BCRType:VALUE? might return<br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BCRType:VALUE "1001", indicating that the BCR Type value for I3C bus Search 2 is "1001" in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:BPACkets

This command sets or queries the I3C Broadcast Packets search to Broadcast or Response.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                             |

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:BPACkets RESPONSE sets the broadcast packets type for I3C bus Search 1 to Response.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BPACkets? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BPACkets RESPONSE, indicating that the broadcast packets type for I3C bus Search 2 is set to Response. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:BRGTID:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is SETBRGTGT packet ID.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                     |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:BRGTID:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:BRGTID:VALue?                                                                                       |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format. |

- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:BRGTID:VALue "1001" sets the Brgtgt search value for I3C bus Search 1 to 1001.
- SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BRGTID:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:BRGTID:VALue "9A", indicating that the Brgtgt search value for I3C bus trigger Search 2 is 9A in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:CCODE:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is SETBRGTGT packet ID.

Requires purchase and installation of option SRI3C.

- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:CCODE:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:CCODE:VALue?
- Arguments** SEARCH<x> specifies the search number.
- <QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and A-F, 0-9, and X for Hexadecimal format.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:CCODE:VALue "1001" sets the command code value for I3C bus Search 1 to Binary 1001.
- SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:CCODE:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:CCODE:VALue "1001", indicating that the command code value for I3C bus Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:CONDition

This command sets or queries the trigger condition for the specified I3C bus trigger search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:CONDition  
{START|REPEATStart|ADDRESS|DATA|}

SDRDirect|SDRBroadcast|DDR|ERRORs|HOTJoin|  
 DMSGEnd|BMSGEnd|HDRRestart|HDRExit}  
 SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:CONDITION?

- Arguments**
- SEARCH<x> specifies the search number.
  - START specifies trigger condition as Start.
  - REPEATStart specifies trigger condition as Repeated Start.
  - ADDRESS specifies trigger condition as Address.
  - DATA specifies trigger condition as Data.
  - SDRDirect specifies trigger condition as I3C SDR Direct.
  - SDRBroadcast specifies trigger condition as I3C SDR Broadcast.
  - DDR specifies trigger condition as DDR.
  - ERRORs specifies trigger condition as Errors.
  - HOTJoin specifies trigger condition as Hot-Join.
  - DMSGEnd specifies trigger condition as Direct Message End.
  - BMSGEnd specifies trigger condition as Stop.
  - HDRRestart specifies trigger condition as HDR Restart.
  - HDRExit specifies trigger condition as HDR Exit.

- Examples**
- SEARCH:SEARCH3:TRIGGER:A:BUS:I3C:CONDITION START sets the trigger condition for I3C bus trigger Search 3to Start.
  - SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:CONDITION? might return SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:CONDITION ADDRESS, indicating that the trigger condition for I3C bus trigger search 1 is set to Address.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:DATA:DIRection

This command sets or queries the direction of the data for the I3C bus trigger search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:DATA:DIRection  
 {NOCARE|READ|WRITE}  
 SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:DATA:DIRection?

|                  |                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p>SEARCH&lt;x&gt; specifies the search number.</p> <p>NO CARE specifies the data direction for which to search is Don't Care.</p> <p>READ specifies the data direction for which to search is Read.</p> <p>WRITE specifies the data direction for which to search is Write.</p>                                         |
| <b>Examples</b>  | <p>SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DATA:DIRECTION READ sets the data direction for I3C bus Search 1 to READ.</p> <p>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DATA:DIRECTION? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DATA:DIRECTION NOCARE, indicating that the data direction of the I3C bus Search 2 is Don't Care.</p> |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DATA:SIZE

This command sets or queries the length of the data string in bytes used for the specified I3C bus trigger search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DATA:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DATA:SIZE?                                                                                                                                                                                                                 |
| <b>Arguments</b> | <p>SEARCH&lt;x&gt; specifies the search number.</p> <p>&lt;NR1&gt; specifies the data size in bytes.</p>                                                                                                                                                                                                            |
| <b>Examples</b>  | <p>SEARCH:SEARCH4:TRIGGER:A:BUS:I3C:DATA:SIZE 1 sets the length of the data string for I3C bus Search 4 to 1 byte.</p> <p>SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DATA:SIZE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DATA:SIZE 3, indicating that the length of the data string for I3C bus Search 1 is 3 bytes.</p> |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DATA:VALue

This command sets or queries the data value of the data token for the specified I3C bus trigger search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the data value. The valid characters are 0, 1, or X for Binary format; and A-F, 0-9, and X for Hexadecimal format.                                                                                                                               |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DATA:VALUE "1001" sets the data value for I3C bus trigger Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DATA:VALUE? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DATA:VALUE "XX", indicating that the data value for I3C bus Search 2 is "XX" in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCR:VALue

This command sets or queries the binary field string used for the I3C bus search if the trigger condition is DCR.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCR:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCR:VALue?                                                                                                                                                                                                 |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.                                                                                                     |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DCR:VALue "1001" sets the DCR value for I3C bus Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DCR:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DCR:VALue "1001", indicating that the DCR value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCRType:VALue

This command sets or queries the binary field string used for the I3C bus search if the trigger condition is DCRTYPE.

Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCRType:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DCRType:VALue?

**Arguments** SEARCH<x> specifies the search number.  
  
<QString> specifies the data value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DCRType:VALue "1001" sets the DCR Type value for I3C bus Search 1 to "1001".  
  
SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DCRType:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DCRType:VALue "1001", indicating that the DCR Type value for I3C bus Search 2 is "1001" in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DWORd:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is DATAWORDS.

Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DWORd:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:DWORd:VALue?

**Arguments** SEARCH<x> specifies the search number.  
  
<QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:DWORD:VALUE "1001"` sets the data word value for I3C bus Search 1 to 1001.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DWORD:VALUE?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:DWORD:VALUE "1001"`, indicating that the **event byte** value for I3C bus Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ERRORTYPE

This command sets or queries the error type condition for the specified I3C bus search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

- Group**     Search and Mark
- Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ERRORTYPE {NACK|TBIT|PARity| BADDR|DADDR|PREamble|CRC}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ERRORTYPE?`
- Arguments**     `SEARCH<x>` specifies the search number.
- `NACK` specifies the error type on which to search as Missing Ack.
- `TBIT` specifies the error type on which to search as T-Bit.
- `PARity` specifies the error type on which to search as Parity.
- `BADDR` specifies the error type on which to search as Broadcast Address.
- `DADDR` specifies the error type on which to search as Dynamic Address.
- `PREamble` specifies the error type on which to search as Preamble.
- `CRC` specifies the error type on which to search as CRC.
- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:ERRORTYPE NACK` sets the error condition for I3C bus trigger Search 1 to Missing ack.
- `SEARCH:SEARCH3:TRIGGER:A:BUS:I3C:ERRORTYPE?` might return `SEARCH:SEARCH3:TRIGGER:A:BUS:I3C:ERRORTYPE PARITY`, indicating that the error condition for I3C bus trigger Search 3 is set to Parity.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:EVENTBYTE:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is EVENTBYTE.

Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:EVENTBYTe:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:EVENTBYTe:VALue?

**Arguments** SEARCH<x> specifies the search number.  
  
<QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:EVENTBYTe:VALue "1001" sets the event byte value for I3C bus Search 1 to 1001.  
  
SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:EVENTBYTe:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:EVENTBYTe:VALue "1001", indicating that the event byte value for I3C bus trigger Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:FREQBYTe:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is FREQUENCYBYTE.

Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:FREQBYTe:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:FREQBYTe:VALue?

**Arguments** SEARCH<x> specifies the search number.  
  
<QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:FREQBYTe:VALue "1001" sets the frequency byte value for I3C bus Search 1 to 1001.  
  
SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:FREQBYTe:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:FREQBYTe:VALue "1001",

indicating that the frequency byte value for I3C bus Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:GSLsb:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is GETSTATUSLSB.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                                   |

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:GSLsb:VALue "1001" sets the GetStatus MSb value for I3C bus Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:GSLsb:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:GSLsb:VALue "1001", indicating that the GetStatus MSb value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:GSMSb:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is GETSTATUSMSB.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                     |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:GSMSb:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:GSMSb:VALue?                                                                                         |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format. |

- Examples**    `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:GSMsb:VALue "1001"` sets the `GetStatus MSb` value for I3C bus Search 1 to 1001.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:GSMsb:VALue?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:GSMsb:VALue "1001"`, indicating that the `GetStatus MSb` value for I3C bus Search 2 is 1001 in hexadecimal format.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ID:VALue**

This command sets or queries the binary field string used for the I3C search if the trigger condition is ENTDAAs packet ID.

Requires purchase and installation of option SRI3C.

- Group**    Search and Mark
- Syntax**    `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ID:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:ID:VALue?`
- Arguments**    `SEARCH<x>` specifies the search number.
- `<QString>` specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.
- Examples**    `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:ID:VALue "1001"` sets the ID value for I3C bus trigger Search 1 to 1001.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:ID:VALue?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:ID:VALue "1001"`, indicating that the ID value for I3C bus Search 2 is 1001 in hexadecimal format.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:INACCByTe:VALue**

This command sets or queries the binary field string used for the I3C search if the trigger condition is INACCURACYBYTE.

Requires purchase and installation of option SRI3C.

- Group**    Search and Mark
- Syntax**    `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:INACCByTe:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:INACCByTe:VALue?`

- Arguments** SEARCH<x> specifies the search number.
- <QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:INACCBYTE:VALue "1001" sets the inaccuracy byte value for I3C bus Search 1 to 1001.
- SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:INACCBYTE:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:INACCBYTE:VALue "1001", indicating that the inaccuracy byte value for I3C bus Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:MAXREAD:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is MAXREAD.

Requires purchase and installation of option SRI3C.

- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:MAXREAD:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:MAXREAD:VALue?
- Arguments** SEARCH<x> specifies the search number.
- <QString> specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:MAXREAD:VALue "1001" sets the Maximum Read value for I3C bus Search 1 to 1001.
- SEARCH:SEARCH4:TRIGGER:A:BUS:I3C:MAXREAD:VALue? might return SEARCH:SEARCH4:TRIGGER:A:BUS:I3C:MAXREAD:VALue "1001", indicating that the Maximum Read value for I3C bus Search 4 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:MAXRTURN:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is MAXREADTURN.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                                                                |

| <b>Examples</b>  | SEARCH:SEARCH5:TRIGGER:A:BUS:I3C:MAXRTURN:VALue "1001" sets the Maximum Read Turnaround value for I3C bus Search 5 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:MAXRTURN:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:MAXRTURN:VALue "1001", indicating that the Maximum Read Turnaround value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:MAXWRITE:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is MAXWRITE.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                                            |

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:MAXWRITE:VALue "1001" sets the Maximum Write value for I3C bus Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:MAXWRITE:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:MAXWRITE:VALue "1001", indicating that the Maximum Write value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:PACKets

This command sets or queries the I3C Direct Packets to Direct or Response.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SADdress:VALue

This command sets or queries the binary field string used for the I3C bus search if the trigger condition is SLAVEADDRESS.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                             |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SADdress:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SADdress:VALue?                                                                                           |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the address value for which to search. The valid characters are 0, 1, or X for Binary format; and A-F, 0-9, and X for Hexadecimal format. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:SADdress:VALue "1001" sets the slave address value for I3C bus trigger search 1 to "1001".                                                                                 |

SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:SADDRESS:VALUE? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:SADDRESS:VALUE "1001", indicating that the slave address value for I3C bus Search 2 is 1001 in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket

This command sets or queries the SDR broadcast packets for the specified I3C bus trigger search to determine where to place a mark.

**Conditions** Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket {ENSLave| DISLave| ENTAsx| RSTDya| ENTRDya| SETMwr1| SETMrd1| LSLave| ENTRTSTMode| EXTIme| SETAasa| ENDXFER| SETGRPa| RSTACT| DEFGRPa| RSTGRPa| MLANE| SETBUSCON} SEARCH:SEARCH<x>:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket?

**Arguments** SEARCH<x> specifies the search number.

ENSLave specifies the I3C broadcast packet type as Enable Slave.

DISLave specifies the I3C broadcast packet type as Disable Slave.

ENTAsx specifies the I3C broadcast packet type as Enter Activity State.

RSTDya specifies the I3C broadcast packet type as Reset Dynamic Address.

ENTRDya specifies the I3C broadcast packet type as Enter Dynamic Address.

SETMwr1 specifies the I3C broadcast packet type as Set Max Write Length.

SETMrd1 specifies the I3C broadcast packet type as Set Max Read Length.

LSLave specifies the I3C broadcast packet type as Define List of Slaves.

ENTRTSTMode specifies the I3C broadcast packet type as Enter Test Mode Broadcast.

EXTIme specifies the I3C broadcast packet type as Set Exchange Time.

SETAasa specifies the I3C broadcast packet type as Set Static As Dynamic Address.

ENDXFER specifies the I3C broadcast packet type as Data Transfer Ending Procedure Control.

SETGRPa specifies the I3C broadcast packet type as Set Group Address.

RSTACT specifies the I3C broadcast packet type as Slave Reset Action.

DEFGRPa specifies the I3C broadcast packet type as Define List of Group Addresses.

RSTGRPa specifies the I3C broadcast packet type as Reset Group Address.

MLANE specifies the I3C broadcast packet type as Multi-Lane Data Transfer Control.

SETBUSCON specifies the I3C broadcast packet type as Set Bus Context.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket ENSLave sets the trigger condition for I3C bus trigger search 1 to Enable Slave.

SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket? might return SEARCH:SEARCH5:TRIGGER:A:BUS:I3C:SDR:BROADCASTPacket ENRDYA, indicating that the trigger condition for I3C bus trigger Search 5 is set to Reset Dynamic Address.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SDR:DIRECTPacket

This command sets or queries the SDR direct packet types for the specified I3C bus trigger search to determine where to place a mark.

Requires purchase and installation of option SRI3C.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SDR:DIRECTPacket {ENSLave| DISLave| ENTAsx| RSTDya| SETMwr1| SETMrd1| SETExt| SETDya| SETNdyA| GETMwr1| GETMrd1| GETPrId| GETBusch| GETDevch| GETS1ave| ACCM| SETBrt| MDATASpeed| HDRCapability|GETXTime| GETCAPS| ENDXFER| SETGRPa| RSTACT| DEFGRPa| RSTGRPa| MLANE}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SDR:DIRECTPacket?

**Arguments** SEARCH<x> specifies the search number.

ENSLave specifies the trigger condition as Enable Slave.

DISLave specifies the trigger condition as Disable Slave.

ENTAsx specifies the trigger condition as Enter Activity State.

RSTDya specifies the trigger condition as Reset Dynamic Address.

SETMwr1 specifies the trigger condition as Set Max Write Length.

SETMrdl specifies the trigger condition as Set Max Read Length.

SETExt specifies the trigger condition as Set Exchange Time.

SETDya specifies the trigger condition as Set Dynamic Address.

SETNdya specifies the trigger condition as Set New Dynamic Address.

GETMwr1 specifies the trigger condition as Get Max Write Length.

GETMRdl specifies the trigger condition as Get Max Read Length.

GETPrId specifies the trigger condition as Get Provisional ID.

GETBUSch specifies the trigger condition as Get Provisional ID.

GETDevch specifies the trigger condition as Get Dev Characteristics.

GETS1ave specifies the trigger condition as Get Slave Current Status.

ACCM specifies the trigger condition as Get Accept Mastership.

SETBrT specifies the trigger condition as Set Bridge Direct Target.

MDATASpeed specifies the trigger condition as Get Max Data Speed.

HDRCapability specifies the trigger condition as Get HDR Capability.

GETXTIME specifies the trigger condition as Get Exchange Time.

GETCAPS specifies the trigger condition as Get Optional Feature Capabilities.

ENDXFER specifies the trigger condition as Data Transfer Ending Procedure Control.

SETGRPa specifies the trigger condition as Set Group Address.

RSTACT specifies the trigger condition as Reset Group Address.

DEFGRPa specifies the trigger condition as Define List of Group Addresses.

RSTGRPa specifies the trigger condition as Reset Group Address.

MLANE specifies the trigger condition as Multi-Lane Data Transfer Control.

**Examples**

SEARCH:SEARCH4:TRIGGER:A:BUS:I3C:SDR:DIRECTPacket ENSLave sets the trigger condition for I3C bus trigger Search 4 to Enable Slave.

SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:SDR:DIRECTPacket? might return SEARCH:SEARCH8:TRIGGER:A:BUS:I3C:SDR:DIRECTPacket ENTASX, indicating that the trigger condition for I3C bus Search 8 is set to Enter Activity State.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:STATEBYTe:VALue

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is STATEBYTE.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                                                                                                                                                         |

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:STATEBYTe:VALue "1001" sets the state byte value for I3C bus Search 1 to 1001.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:STATEBYTe:VALue? might return SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:STATEBYTe:VALue "1001", indicating that the state byte value for I3C bus Search 2 is 1001 in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:STATic:ADDRess

This command sets or queries the binary field string used for the I3C search if the trigger condition is STATICADDRESS.

Requires purchase and installation of option SRI3C.

|                  |                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                             |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:STATic:ADDRess <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:STATic:ADDRess?                                                                                           |
| <b>Arguments</b> | SEARCH<x> specifies the search number.<br><br><QString> specifies the address value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format. |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:STATic:ADDRESS "1001"` sets the address value for I3C bus trigger Search 1 to 1001.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:STATic:ADDRESS?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:STATic:ADDRESS "1001"`, indicating that the address value for I3C bus trigger Search 2 is "1001" in hexadecimal format.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SUPPORTBYTe:VALue**

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is SUPPORTEDBYTE.

Requires purchase and installation of option SRI3C.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SUPPORTBYTe:VALue`  
                  `<QString>`  
                  `SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:SUPPORTBYTe:VALue?`

**Arguments**     `SEARCH<x>` specifies the search number.

`<QString>` specifies the value for which to search. The valid characters are 0, 1, or X for Binary format; and 0-9, A-F, and X for Hexadecimal format.

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:I3C:SUPPORTBYTe:VALue "1001"` sets the supported byte value for I3C bus Search 1 to 1001.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:SUPPORTBYTe:VALue?` might return `SEARCH:SEARCH2:TRIGGER:A:BUS:I3C:SUPPORTBYTe:VALue "1001"`, indicating that the supported byte value for I3C bus Search 2 is 1001 in hexadecimal format.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:I3C:TESTMODE:VALue**

This command sets or queries the binary field string used for the I3C trigger if the trigger condition is TESTMODE.

Requires purchase and installation of option SRI3C.

**Group**     Search and Mark

| <b>Arguments</b>  | <QString> specifies the data value.                                                                                                                                                                                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH2:TRIGger:A:BUS:LIN:DATA:VALue 1010 sets the data value to XXXXXX1010.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:LIN:DATA:VALue? might return<br>SEARCH:SEARCH1:TRIGGER:A:BUS:LIN:DATA:VALUE "XXXXXXXXXX",<br>indicating that the data value is a don't care. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:ERRTYPE

This command sets or queries the error type for a LIN bus search. The search number is specified by x. The search condition must be set to ERROR.

|                   |                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:ERRTYPE<br>{CHECKsum PARity SYNC}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:ERRTYPE?                            |
| <b>Arguments</b>  | CHECKsum specifies the error type is checksum.<br><br>PARity specifies the error type is parity.<br><br>SYNC specifies the error type is sync. |

**Examples**     `SEARCH:SEARCH2:TRIGger:A:BUS:LIN:ERRTYPE` Parity sets the error type to parity.

`SEARCH:SEARCH2:TRIGger:A:BUS:LIN:ERRTYPE?` might return  
`:SEARCH:SEARCH2:TRIGGER:A:BUS:LIN:ERRTYPE SYNC`, indicating that the error type is sync.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:IDentifier:VALue**

This command sets or queries the string used for a LIN bus identifier value. The search number is specified by x. The search condition must be IDENTIFIER or IDANDDATA.

**Conditions**     Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group**            Search and Mark

**Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:IDentifier:VALue`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:LIN:IDentifier:VALue?`

**Arguments**     `<QString>` specifies the identifier value.

**Examples**        `SEARCH:SEARCH1:TRIGger:A:BUS:LIN:IDentifier:VALue 1010` sets the identifier value to XX1010.

`SEARCH:SEARCH1:TRIGger:A:BUS:LIN:IDentifier:VALue?` might return  
`SEARCH:SEARCH1:TRIGGER:A:BUS:LIN:IDENTIFIER:VALUE "XXXXXX"`, indicates the identifier value is don't care.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition**

This command specifies a field or condition for an Manchester bus to search on. The search number is specified by x.

**Conditions**     Requires the SR-MANCH Triggering and Analysis application.

**Group**            Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition  
{SYNCBITS| HEADer| DATA| packetOffData| TRAIler| ERRors}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition?

**Related Commands** [BUS:B<x>:MANChester:DISplaymode](#)

**Arguments** SYNCBITS specifies Sync Bits symbols as the field within an Manchester frame to search on.

HEADer specifies header symbols as the field within an Manchester frame to search on.

DATA specifies data symbols as the field within an Manchester frame to search on.

packetOffData specifies the binary string used for Manchester triggering if the trigger condition is DATA.

TRAIler specifies trailer symbols as the field within an Manchester frame to search on.

ERRors specifies error symbols as the field within an Manchester frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MANChester:CONDition SYNCBITS specifies Sync Bit symbols as the field within an Manchester frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:MANChester:CONDition? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:MANChester:CONDition SYNCBITS, indicating that Sync Bits is the currently specified field within an Manchester frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:DATA:SIZE

This command specifies the number of bits per word for the specified Manchester bus. The search number is specified by x.

**Conditions** Requires the SR-MANCH Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:DATA:SIZE?

|                         |                                                                                                                                                                                                                                                                                                                                                   |

| <b>Arguments</b>        | SEARCH<x> is the number of the search.<br><br><NR1> specifies the data string in a valid format. The minimum and default values are 1. The maximum value is 5.                                                                                                                                                                                    |
| <b>Examples</b>         | SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:SIZE 2 sets the data string for Manchester bus trigger search 1 to 2 bits.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:SIZE 2, indicating that the length of the data string for Manchester bus trigger search 1 is 2 bits. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:DATA:VALue

This command specifies the binary string used for Manchester triggering if the trigger condition is data when searching on an Manchester signal. The search condition needs to be set to data. The search number is specified by <x>.

|                         |                                                                                                                                                                                                                                                                                                                                 |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:HEADer:VALue

This command specifies the binary string used for Manchester triggering if the trigger condition is header when searching on an Manchester signal. The search condition needs to be set to header. The search number is specified by <x>.

|                   |                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires the SR-MANCH Triggering and Analysis application.                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:HEADer:VALue<br><Qstring><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:HEADer:VALue? |

**Related Commands** [BUS:B<x>:MANChester:DISplaymode](#), [SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition](#)

**Arguments** <QString> is the header value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:VALue "00001000" specifies binary as the value to be used while searching.

SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:DATA:VALue "00001000", indicating the binary header value to be used while searching.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:packetOffData:VALue

This command specifies the binary string used for Manchester triggering if the trigger condition is DATA. The search number is specified by <x>.

**Conditions** Requires the SR-MANCh Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:packetOffData:VALue <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:packetOffData:VALue?

**Related Commands** [BUS:B<x>:MANChester:DISplaymode](#), [SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition](#)

**Arguments** <NR1> specifies the data string in a valid format.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:MANChesterDATAOFF:VALue 1 specifies binary as the value to be used while searching.

SEARCH:SEARCH1:TRIGger:A:BUS:MANChesterDATAOFF:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:MANChesterDATAOFF:VALue 1, indicating the binary value to be used while searching.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:SYNC:VALue

This command specifies the binary string used for Manchester triggering if the trigger condition is Sync when searching on an Manchester signal. The search condition needs to be set to Sync. The search number is specified by <x>.

|                         |                                                                                                                                                                                                                                                                                                                                       |

| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:TRAILER:VALue<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:TRAILER:VALue? |

**Related Commands** [BUS:B<x>:MANChester:DISplaymode](#), [SEARCH:SEARCH<x>:TRIGger:A:BUS:MANChester:CONDition](#)

**Arguments** <QString> specifies the data string in a valid format.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:TRAILER:VALue "00001000" specifies binary as the value to be used while searching.

SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:TRAILER:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:MANChester:TRAILER:VALue "00001000", indicating the binary value to be used while searching.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:ADDRESS:VALue

This command specifies the binary address string used for MDIO triggering if the trigger condition is address. The search number is specified by x.

**Conditions** Requires option SR-MDIO.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:ADDRESS:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:ADDRESS:VALue?

**Arguments** <QString> is the address value. Default address value is XXXXXXXXXXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:ADDRESS:VALue "XXXXXXXXXXXXXXXXXX" specifies address value as the field within a MDIO frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:ADDRESS:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:ADDRESS:VALue "XXXXXXXXXXXXXXXXXX", indicating that data is the currently specified field within a MDIO frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:CONDition

This command sets or queries the trigger condition for MDIO bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DATA:VALue

This command specifies the binary data string used for MDIO triggering if the trigger condition is DATA. The search number is specified by x.

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-MDIO.                                                                                    |
| <b>Group</b>      | Search and Mark                                                                                             |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DATA:VALue? |

**Arguments** <QString> is the data value. Default value is XXXXXXXXXXXXXXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DATA:VALue  
 "XXXXXXXXXXXXXXXXXX" specifies data as the field within a MDIO frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DATA:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DATA:VALue "XXXXXXXXXXXXXXXXXX", indicating that data is the currently specified field within a MDIO frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DEViCetype:VALue

This command specifies the binary device type string used for MDIO triggering if the trigger condition is Device type. The search number is specified by x.

**Conditions** Requires option SR-MDIO.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DEViCetype:VALue  
 <QString>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:DEViCetype:VALue?

**Arguments** <QString> is the device type. Default value is XXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DEViCetype:VALue "XXXXX"  
 specifies device type as the field within a MDIO frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DEViCetype:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:MDIO:DEViCetype:VALue "XXXXX", indicating that device type is the currently specified field within a MDIO frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MDIO:ERRType

This command sets or queries the error type to be used when triggering on MDIO data. This applies when the MDIO bus trigger condition is set to ERRor. The search number is specified by x.

**Conditions** Requires option SR-MDIO.

|                  |                                                                                                                                                                                                                                                                                                                                |

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:HIVALUE

This command sets or queries the high value when searching on command word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to COMMAND, and the address qualifier must be INrange or OUTrange.

|                   |                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                       |
| <b>Syntax</b>     | <p>SEARCH:SEARCH&lt;x&gt;:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:HIVALUE &lt;QString&gt;</p> <p>SEARCH:SEARCH&lt;x&gt;:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:HIVALUE?</p>                                                            |
| <b>Arguments</b>  | <QString> is the address value.                                                                                                                                                                                                       |
| <b>Examples</b>   | <p>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:HIVALUE "X1000" sets the value to X1000.</p> <p>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:HIVALUE? might return "XXXXX", indicating that the value is XXXXX.</p> |

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:QUALIFIER

This command sets or queries the qualifier to be used when searching on command word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:ADDRESS:QUALifier {EQUAL|UNEQUAL|LESSthan|MOREthan|LESSEQUAL|MOREEQUAL|INrange|OUTrange} SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:ADDRESS:QUALifier?

**Arguments** EQUAL sets the data qualifier to equal.  
 LESSEQUAL sets the data qualifier to less equal.  
 MOREEQUAL sets the data qualifier to more equal.  
 UNEQUAL sets the data qualifier to unequal.  
 LESSthan sets the data qualifier to less than.  
 MOREthan sets the data qualifier to more than.  
 INrange sets the data qualifier to in range.  
 OUTrange sets the data qualifier out of range.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:QUALIFIER LESSTHAN sets the address qualifier to less than.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:QUALIFIER? might return EQUAL, indicating that the address qualifier is set to equal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:ADDRes:VALue

This command sets or queries the low value when searching on command word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:ADDRESS:VALUE <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:ADDRESS:VALUE?

**Arguments** <QString> is the address value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:VALUE "X1000" sets the value to X1000.  
SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:ADDRESS:VALUE? might return "XXXXXX", indicating that the value is XXXXXX.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:COUNT

This command sets or queries the value of the command word "word count" field for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:COUNT <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:COUNT?

**Arguments** <QString> is the word count value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:COUNT "X1000" sets the value to X1000.  
SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:COUNT? might return "XXXXXX", indicating that the value is XXXXXX.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:PARity

This command sets or queries the value of the command word parity bit for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to COMMAND.

|                   |                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                                                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                   |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:SUBAddress

This command sets or queries the value of the command word subaddress field for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to COMMAND.

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                           |
| <b>Group</b>      | Search and Mark                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:SUBAddress<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:SUBAddress? |
| <b>Arguments</b>  | <QString> is the word count value.                                                                                                     |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:SUBADDRESS`  
"X1000" sets the value to X1000.

`SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:SUBADDRESS?`  
might return "XXXXX", indicating that the value is XXXXX.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:TRBit**

This command sets or queries the value of the command word Transmit / Receive bit for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to COMMAND.

**Conditions**     Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group**             Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:TRBit`  
`{RX|TX|X}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:COMMAND:TRBit?`

**Arguments**        RX filters command words to only match those that are receive packets.  
TX filters command words to only match those that are transmit packets.  
X disables filtering of command words on the R/T bit.

**Examples**         `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:TRBIT TX`  
specifies filtering command words for only transmit messages.

`SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:COMMAND:TRBIT?` might  
return X, indicating that command words are not being filtered based on the R/T  
bit value.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:CONDition**

This command sets or queries the field or condition for a MIL-STD-1553 bus to search on. The search number is specified by x.

**Conditions**        Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

|                  |                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                      |

| <b>Arguments</b> | <p>SYNC specifies a search for the sync pulse of any word.</p> <p>COMMAND specifies a search for a matching command word.</p> <p>STATus specifies a search for a matching status word.</p> <p>DATA specifies a search for a matching data word.</p> <p>ERRor specifies a search for a specified error condition.</p> |
| <b>Examples</b>  | <p>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:CONDITION DATA specifies finding matching data word(s).</p> <p>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:CONDITION? might return SYNC, indicating that the bus is being searched for sync pulses found in any word.</p>                                                         |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:PARity

This command sets or queries the value of the command word parity bit for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to DATA.

|                   |                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                                         |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                      |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:PARity<br>{ONE ZERO NOCARE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:PARity?                                                                                                                     |
| <b>Arguments</b>  | <p>ONE filters data words to only match those where the parity bit has a value of 1.</p> <p>ZERO filters data words to only match those where the parity bit has a value of 0.</p> <p>NOCARE disables filtering of data words on the parity bit.</p> |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:DATA:PARITY ONE` specifies filtering data words for those where the parity bit has a value of 1.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:DATA:PARITY?` might return `NOCARE`, indicating that data words are not being filtered based on the parity bit value.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:VALue**

This command sets or queries the value when searching on data words for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to `DATA`.

- Conditions**     Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.
- Group**            Search and Mark
- Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:DATA:VALue?`
- Arguments**        `<QString>` is the data value.
- Examples**         `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:DATA:VALUE`  
                      `"XXXXXXXXXXXX1000"` sets the value to `XXXXXXXXXXXX1000`.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:DATA:VALUE?` might return `"XXXXXXXXXXXXXXXXXXXX"`, indicating that the value is `XXXXXXXXXXXXXXXXXXXX`.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:ERRTYPE**

This command sets or queries the type of error condition for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to `ERRor`.

- Conditions**        Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.
- Group**            Search and Mark

|                  |                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:ERRTYPe<br>{PARi ty SYNC DATA}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:ERRTYPe?                                                                                                                                               |
| <b>Arguments</b> | PARi ty specifies searching for an incorrectly calculated parity bit in any word.<br><br>SYNC specifies searching for any sync pulse that does not transition in the middle of the pulse as required.<br><br>DATA specifies searching for any non-contiguous data words. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:ERRTYPe DATA specifies searching for non-contiguous data words.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:ERRTYPe? might return PARITY, indicating that the bus is being searched for parity errors in any word.                |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:HIVALue

This command sets or queries the high value when searching on status word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to STATus and the address qualifier must be INrange or OUTrange.

|                   |                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                 |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                              |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:HIVALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:HIVALue?                                                                                  |
| <b>Arguments</b>  | <QString> is the address value.                                                                                                                                                                                              |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:HIVALUE "X1000" sets the value to X1000.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:HIVALUE? might return "XXXXX", indicating that the value is XXXXX. |

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:QUALifier**

This command sets or queries the qualifier used when searching on status word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to STATus.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:QUALifier {Equal|UNEQual|LESSthan|MOREthan|LESSEQual|MOREEQual|INrange|OUTrange}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:QUALifier?

**Arguments** Equal sets the data qualifier to equal.  
LESSEQual sets the data qualifier to less equal.  
MOREEQual sets the data qualifier to more equal.  
UNEQual sets the data qualifier to unequal.  
LESSthan sets the data qualifier to less than.  
MOREthan sets the data qualifier to more than.  
INrange sets the data qualifier to in range.  
OUTrange sets the data qualifier out of range.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:QUALIFIER  
LESSTHAN sets the address qualifier to less than.  
SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:QUALIFIER?  
might return EQUAL, indicating that the address qualifier is set to equal.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:ADDRess:VALue**

This command sets or queries the low value when searching on status word addresses for a MIL-STD-1553 bus. The search number is specified by x. The search condition must be set to STATus.

|                   |                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                  |

| <b>Arguments</b>  | <QString> is the address value.                                                                                                                                                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:VALUE<br>"X1000" sets the value to X1000.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:ADDRESS:VALUE?<br>might return "XXXXXX", indicating that the value is XXXXXX. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:BCR

This command sets or queries the value of the broadcast command received bit (BCR bit, bit 15) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATus.

|                   |                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                       |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                    |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:BCR<br>{ONE ZERO NOCARE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:BCR?                                                                                             |
| <b>Arguments</b>  | ONE filters status words to only match those where the BCR bit has a value of 1.<br>ZERO filters status words to only match those where the BCR bit has a value of 0.<br>NOCARE disables filtering of status words on the BCR bit. |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:BCR ONE<br>specifies filtering status words for those where the BCR bit has a value of 1.                                                                                         |

SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:BCR? might return NOCARE, indicating that status words are not being filtered based on the BCR bit value.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:BUSY

This command sets or queries the value of the busy bit (BUSY bit, bit 16) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATUS.

|                   |                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:DBCA

This command sets or queries the value of the dynamic bus control acceptance bit (DBCA bit, bit 18) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATUS.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SRQ

This command sets or queries the value of the status word service request bit (SRQ bit, bit 11) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATUS.

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                           |
| <b>Group</b>      | Search and Mark                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SRQ<br>{ONE ZERO NOCARE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SRQ? |

**Arguments** ONE filters status words to only match those where the SRQ bit has a value of 1.  
 ZERO filters status words to only match those where the SRQ bit has a value of 0.  
 NOCARE disables filtering of status words on the SRQ bit.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:SRQ ONE specifies filtering status words to those where the SRQ bit has a value of 1.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:SRQ? might return NOCARE, indicating that status words are not being filtered based on the SRQ bit value.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SUBSF

This command sets or queries the value of the subsystem flag bit (SUBSF bit, bit 17) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x>. The search condition must be set to STATus.

**Conditions** Requires SR-AERO Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SUBSF  
 {ONE | ZERO | NOCARE}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:SUBSF?

**Arguments** ONE filters status words to only match those where the SUBSF bit has a value of 1.  
 ZERO filters status words to only match those where the SUBSF bit has a value of 0.  
 NOCARE disables filtering of status words on the SUBSF bit.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:SUBSF ONE specifies filtering status words for those where the SUBSF bit has a value of 1.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:BIT:SUBSF? might return NOCARE, indicating that status words are not being filtered based on the SUBSF bit value.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:TF

This command sets or queries the value of the terminal flag bit (TF bit, bit 19) in a status word for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATUS.

|                   |                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:TF<br>{ONE ZERO NOCARE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:BIT:TF?                                                                                                                                                              |
| <b>Arguments</b>  | ONE filters status words to only match those where the TF bit has a value of 1.<br>ZERO filters status words to only match those where the TF bit has a value of 0.<br>NOCARE disables filtering of status words on the TF bit.                                                                   |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATus:BIT:TF ONE specifies filtering status words for those where the TF bit has a value of 1.<br>SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATus:BIT:TF? might return NOCARE, indicating that status words are not being filtered based on the TF bit value. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:PARity

This command sets or queries the value of the status word parity bit for a MIL-STD-1553 bus to search on. The search number is specified by x. The search condition must be set to STATUS.

|                   |                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                         |
| <b>Group</b>      | Search and Mark                                                                                                                      |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:PARity<br>{ONE ZERO NOCARE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:MIL1553B:STATus:PARity? |

- Arguments** ONE filters status words to only match those where the parity bit has a value of 1.  
 ZERO filters status words to only match those where the parity bit has a value of 0.  
 NOCARE disables filtering of status words on the parity bit.
- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:PARITY ONE specifies filtering status words for those where the parity bit has a value of 1.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:MIL1553B:STATUS:PARITY? might return NOCARE, indicating that status words are not being filtered based on the parity bit value.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:COMManD:CODe

This command sets or queries the trigger on command code for a NFC bus.

- Conditions** Requires option RFNFC.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:COMManD:CODe {INventory| STAYQUIet| RFU| RDSBLOCK| WRSBLOCK| LOCKBLOCK| RDMBLOCK| WRMBLOCK| SELECT15693SET| RSTTOREADy| WRITEAFI| LOCKAFI| WRITEDSFID| LOCKDSFID| GETSYSTEMINfo| GETMBSECSYSTEM| FRDMBLOCK| EXRDSBLOCK| EXWRSBLOCK| EXLOCKBLOCK| EXRDMBLOCK| AUTHenticate| KEYUPDate| AUTHCRYPTo| SECURECRYPTo| CHALenge| READBUFFer| EXGETSYSTINfo| EXGETMBSSTATus| FEXRDMBLOCKs| custom| REQa| WUPa| PROPrietary| SELECT14443A| HLTa| REQb| WUPb| SLOTMARKER| ATTRIB| HLTb| ANY| ATRReq| WUPReq| PSLReq| DEPReq| DSLReq| RLSReq}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:COMManD:CODe?
- Arguments** SEARCH<x> is the number of the search.  
 INventory specifies inventory as the 15693 command code to search on. This is the default command code is for 15693.  
 STAYQUIet specifies STAYQUIet as the 15693 command code to search on.  
 RFU specifies RFU as the 15693 command code to search on.  
 RDSBLOCK specifies RDSBLOCK as the 15693 command code to search on.  
 WRSBLOCK specifies WRSBLOCK as the 15693 command code to search on.  
 LOCKBLOCK specifies LOCKBLOCK as the 15693 command code to search on.

RDMbLOCK specifies RDMbLOCK as the 15693 command code to search on.

WRMBLOCK specifies WRMBLOCK as the 15693 command code to search on.

SELECT15693SET specifies select as the 15693 command code to search on.

RSTTOREADy specifies RSTTOREADy as the 15693 command code to search on.

WRITEAFI specifies WRITEAFI as the 15693 command code to search on.

LOCKAFI specifies LOCKAFI as the 15693 command code to search on.

WRITEDSFID specifies WRITEDSFID as the 15693 command code to search on.

LOCKDSFID specifies LOCKDSFID as the 15693 command code to search on.

GETSYSTEMINFo specifies GETSYSTEMINFo as the 15693 command code to search on.

GETMBSECSYSSTem specifies GETMBSECSYSSTem as the 15693 command code to search on.

FRDMbLOCK specifies FRDMbLOCK as the 15693 command code to search on.

EXRDSbLOCK specifies EXRDSbLOCK as the 15693 command code to search on.

EXWRbLOCK specifies EXWRbLOCK as the 15693 command code to search on.

EXLOCKbLOCK specifies EXLOCKbLOCK as the 15693 command code to search on.

EXRDMbLOCK specifies EXRDMbLOCK as the 15693 command code to search on.

AUTHenticate specifies authenticate as the 15693 command code to search on.

KEYUPDate specifies KEYUPDate as the 15693 command code to search on.

AUTHCRYPto specifies AUTHCRYPto as the 15693 command code to search on.

SECURECRYPto specifies SECURECRYPto as the 15693 command code to search on.

CHALlenge specifies challenge as the 15693 command code to search on.

READbUFFER specifies READbUFFER as the 15693 command code to search on.

EXGETSYSTINFo specifies EXGETSYSTINFo as the 15693 command code to search on.

EXGETMBSSTATus specifies EXGETMBSSTATus as the 15693 command code to search on.

FEXRDMbLOCKs specifies FEXRDMbLOCKs as the 15693 command code to search on.

custom specifies custom as the 15693 command code to search on.

ANY specifies ANY as the 15693 command code to search on.

REQa specifies REQa as the 14443A command code to search on. This is the default command code is for 14443A.

WUPa specifies WUPa as the 14443A command code to search on.

PROPRietary specifies proprietary as the 14443A command code to search on.

SELECT14443A specifies select as the 14443A command code to search on.

HLTa specifies HLTa as the 14443A command code to search on.

REQB specifies REQB as the 14443B command code to search on. This is the default command code is for 14443B.

WUPB specifies WUPB as the 14443B command code to search on.

SLOTMARKER specifies SLOTMARKER as the 14443B command code to search on.

ATTRIB specifies ATTRIB as the 14443B command code to search on.

HLTB specifies HLTB as the 14443B command code to search on.

ATRReq specifies ATRReq as the FeliCa command code to search on. This is the default command code is for FeliCa.

WUPReq specifies WUPReq as the FeliCa command code to search on.

PSLReq specifies PSLReq as the FeliCa command code to search on.

DEPREq specifies DEPREq as the FeliCa command code to search on.

DSLReq specifies DSLReq as the FeliCa command code to search on.

RLSReq specifies RLSReq as the FeliCa command code to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:COMMAND:CODE SELECT15693SET specifies select command code to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:COMMAND:CODE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:COMMAND:CODE SELECT15693SET, indicating that select command code is the currently specified field to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:CONDition

This command sets or queries the trigger condition for a NFC bus.

**Conditions** Requires option RFNFC.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:NFC:CONDition {SOC| SOS| SYNC| CMDCODE| EOC| ERRors| SOF| AFI| PUPi| IDentifier| UID| EOF| PAYLoad| DATA| RESPCODE| EOS}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:NFC:CONDition?

**Arguments** SEARCH<x> is the number of the search.

SOC specifies start in 14443A as the field within a NFC frame to search on. The default trigger on condition is SOC for 14443A.

SOS specifies start in 14443B and Felica as the field within a NFC frame to search on. The default trigger on condition is SOS for 14443B and Felica.

SYNC specifies sync as the field within a NFC frame to search on.

CMDCODE specifies command code as the field within a NFC frame to search on.

EOC specifies end in 14443A as the field within a NFC frame to search on.

ERRors specifies error type as the field within a NFC frame to search on.

SOF specifies start in 15693 as the field within a NFC frame to search on. The default trigger on condition is SOF for 15693.

AFI specifies AFI as the field within a NFC frame to search on.

PUPi specifies PUPi as the field within a NFC frame to search on.

IDentifier specifies identifier as the field within a NFC frame to search on.

UID specifies UID as the field within a NFC frame to search on.

EOF specifies end in 15693 as the field within a NFC frame to search on.

PAYLoad specifies payload as the field within a NFC frame to search on.

DATA specifies data as the field within a NFC frame to search on.

RESPCODE specifies response code as the field within a NFC frame to search on.

EOS specifies end in 14443B and Felica as the field within a NFC frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:CONDition UID specifies UID as the field within a NFC frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:CONDition? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:CONDition UID, indicating that UID is the currently specified field within a NFC frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:SIZE

This command specifies the length of the data string in bytes to be used for an NFC trigger if the trigger condition is DATA.

|                   |                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option RFNFC.                                                                                                                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                               |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:SIZE?                                                                                                                                                           |
| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br><NR1> specifies the data string in a valid format. The minimum and default value is 1. The maximum value is 5.                                                                                                  |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:SIZE 2 specifies data size to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:SIZE 2, indicating that data to be searched on is specified as 2 bytes. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:VALue

This command specifies the binary data string used for NFC triggering if the trigger condition is DATA.

|                   |                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option RFNFC.                                                                                    |
| <b>Group</b>      | Search and Mark                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:DATA:VALue? |
| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br><QString> specifies the data value in a valid format.       |

- Examples**    `SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:VALUE "10110000"`  
specifies data to search on.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:VALUE?` might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:DATA:VALUE "10110000"`,  
indicating the data value is 10110000.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:ERRor:TYPE**

This command sets or queries the error type for NFC bus.

- Conditions**    Requires option RFNFC.
- Group**        Search and Mark
- Syntax**        `SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:ERRor:TYPE {ANY| PARi ty| CRC}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:ERRor:TYPE?`
- Arguments**    `SEARCH<x>` is the number of the search.
- `ANY` searches any error. Applicable for 14443A.
- `PARi ty` searches parity error. Applicable only for 14443A.
- `CRC` searches CRC error. Applicable for all standards.
- Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:ERRor:TYPE PARi ty` specifies  
parity error to search on.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:ERRor:TYPE?` might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:ERRor:TYPE PARi ty`, indicating  
that error type is the currently parity to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:PAYLOADBITS**

This command sets or queries the number of payload bits for the specified bus.

- Conditions**    Requires option RFNFC.
- Group**        Search and Mark

|                  |                                                                                                                                                                                                                                                                                                                                                 |

ATRRes specifies ATRRes as the response code for FeliCa to search on. The default response code is ATRRes for FeliCa.

WUPRes specifies WUPRes as the response code for FeliCa to search on.

PSLRes specifies PSLRes as the response code for FeliCa to search on.

DEPRes specifies DEPRes as the response code for FeliCa to search on.

DSLRes specifies DSLRes as the response code for FeliCa to search on.

RLSRes specifies RLSRes as the response code for FeliCa to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:RESPONSE:CODE SAK specifies the response code to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:RESPONSE:CODE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:RESPONSE:CODE SAK, indicating that SAK response code is the currently specified field to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:TYPE

This command sets or queries the trigger command/response type for a NFC bus.

**Conditions** Requires option RFNFC.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:TYPE {COMMAND| RESPONSE}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:TYPE?

**Arguments** SEARCH<x> is the number of the search.

COMMAND specifies command code as the type to search on. This is the default trigger.

RESPONSE specifies response code as the type to search on.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:NFC:TYPE RESPONSE specifies response code as the type to search on.

SEARCH:SEARCH1:TRIGger:A:BUS:NFC:TYPE? might return :SEARCH:SEARCH1:TRIGger:A:BUS:NFC:TYPE RESPONSE, indicating that response code is the type to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NFC:UID:VALue

This command specifies the binary data string used for NFC triggering if the trigger condition is UID.

|                   |                                                                                                                                                                                                                                                   |

| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:UID:VALue "10110000" specifies data to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:UID:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:NFC:UID:VALue "10110000", indicating the data value is 10110000. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:CONDition

This command specifies a field or condition for an NRZ bus to search on. The search number is specified by x.

|                         |                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires the SRNRZ Triggering and Analysis application.                                               |
| <b>Group</b>            | Search and Mark                                                                                       |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:CONDition {DATA}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:CONDition?  |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:NRZ:DATA:SIZE</a>                                    |
| <b>Arguments</b>        | SEARCH<x> is the number of the search.<br><br>DATA specifies the search condition as Data Characters. |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:CONDition DATA` specifies data as the field within an NRZ frame to search on.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:CONDITION?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:CONDITION DATA`, indicating that DATA is the currently specified field within an NRZ frame to search on.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:DATA:SIZE**

This command specifies the length of the data string, in bytes, to use when searching on the NRZ signal. The search condition needs to be set to DATA. The search number is specified by x.

- Conditions**     Requires the SRNRZ Triggering and Analysis application.
- Group**           Search and Mark
- Syntax**          `SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:DATA:SIZE <NR1>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:DATA:SIZE?`
- Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:CONDition](#)
- Arguments**        `SEARCH<x>` is the number of the search.
- `<NR1>` specifies the data string in a valid format. The minimum and default values are 1. The maximum value is 5.
- Examples**         `SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:DATA:SIZE 1` sets the data string for NRZ bus trigger search 1 to 1 byte.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:DATA:SIZE?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:NRZ:DATA:SIZE 3`, indicating that the length of the data string for NRZ bus trigger search 1 is 3 bytes.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:NRZ:DATA:VALue**

This command sets or queries the binary data value to be used when searching on a NRZ signal. The search condition must be set to DATA.

- Conditions**        Requires the SRNRZ Triggering and Analysis application.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:CONDition

This command sets or queries the trigger condition for a ONEWIRE bus. MODE should be set to Overdrive for OVERDRIVEMATCH and OVERDRIVESKIP. MODE should be set to Standard for READROM, MATCHROM, SKIPROM, SEARCHROM, ALARMSEARCH. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:DATA:VALue

This command specifies the binary data string used for ONEWIRE triggering if the trigger condition is DATA.

|                   |                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires the option SR-ONEWIRE.                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                   |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:DATA:VALue?                                                 |
| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br><QString> specifies the data value in a valid format. The default size and value for DATA is 8 bits and "XXXXXXXX". |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:DATA:VALUE "0111100111"`  
sets the Data value as "0111100111".

`SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:DATA:VALUE?` might  
return `:SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:DATA:VALUE`  
"0111100111", indicating that the data value is "0111100111".

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE**

This command sets or queries the family code for Match ROM in ONEWIRE bus. MODE should be set to Standard.

**Conditions**     Requires the option SR-ONEWIRE.

**Group**           Search and Mark

**Syntax**          `SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE?`

**Arguments**     `SEARCH<x>` is the number of the search.  
  
`<QString>` specifies the binary string used for Family Code triggering. The default size and value of family code for Match ROM is 8 bits and "XXXXXXXX".

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE`  
`"11000000"` specifies the binary string used for Family Code triggering if the  
trigger condition is MatchROM to "11000000".  
  
`SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE?`  
might return  
`:SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:MATCHROM:FAMILYCODE`  
`"0111100111"`, indicating that the value of the family code set for Match ROM  
is "0111100111".

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:MATCHROM:SERIALNUMBER**

This command sets or queries the serial number for Match ROM in ONEWIRE bus. MODE should be set to Standard.

**Conditions**     Requires the option SR-ONEWIRE.

| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br><QString> specifies the binary string used for Family Code triggering. The default size and value of family code for Overdrive match ROM is 8 bits and "XXXXXXXX". |

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:FAMILYCODE "11000011" specifies the binary string used for Family Code triggering if the trigger condition is Overdrive match ROM to "11000011".

SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:FAMILYCODE? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:FAMILYCODE "0111100111", indicating that the value of the family code set for Overdrive Match ROM is "0111100111".

## SEARCH:SEARCH<x>:TRIGGer:A:BUS:ONEWIRE:OVERDRIVE:SERIALNUMBER

This command sets or queries the serial number for Overdrive Match ROM in ONEWIRE bus. MODE should be set to Overdrive.

**Conditions** Requires the option SR-ONEWIRE.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGer:A:BUS:ONEWIRE:OVERDRIVE:  
SERIALNUMBER <QString>  
SEARCH:SEARCH<x>:TRIGGer:A:BUS:ONEWIRE:OVERDRIVE:  
SERIALNUMBER?

**Arguments** SEARCH<x> is the number of the search.

<QString> specifies the binary string used for Serial Number triggering. The default size and value of serial number for Overdrive match ROM is 48 bits and "XXXXXXXX XXXXXXXXXXX XXXXXXXXXXX XXXXXXXXXXX XXXXXXXXXXX XXXXXXXXXXX".

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:SERIALNUMBER "11000010" specifies the binary string used for Serial Number triggering if the trigger condition is Overdrive match ROM and set it to "11000010".

SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:SERIALNUMBER? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:ONEWIRE:OVERDRIVE:SERIALNUMBER "0111100111", indicating that the value of the serial number set for Overdrive Match ROM is "0111100111".

**SEARCH:SEARCH<x>:TRIGger:A:BUS:ONEWIRE:READROM:FAMILYCODE**

This command sets or queries the family code for Read ROM in ONEWIRE bus. MODE should be set to Standard.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PARAllel:DATa:VALue

This command sets or queries the binary data string used for a parallel bus search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:PARAllel:DATa:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PARAllel:DATa:VALue?                                                                                                                                                                                                                                                            |
| <b>Arguments</b> | <QString> specifies the data value in a valid format. Valid characters are 0-9,                                                                                                                                                                                                                                                                                                |
| <b>Examples</b>  | SEARCH:SEARCH2:TRIGGER:A:BUS:PARALLEL:DATA:VALUE "XXXXXXXX"<br>sets the string data value to "XXXXXXXX" in binary format.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:PARALLEL:DATA:VALUE? might<br>return SEARCH:SEARCH1:TRIGGER:A:BUS:PARALLEL:DATA:VALUE<br>"XXXXXXXXXXXXXXXXX10010", indicating that the data value string is set to<br>"XXXXXXXXXXXXXXXXX10010" in binary format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CHEADer

This command sets or queries the Sync header type for Custom pattern to trigger on a PCIe Gen 3. The search number is specified by x.

|                   |                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPCIE321                                                                                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                                |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CHEADer<br>{CONTROL DATA EITHER}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CHEADer?                                           |
| <b>Arguments</b>  | CONTROL specifies the search condition as control.<br><br>DATA specifies the search condition as data.<br><br>EITHER specifies the search condition as either. |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CHEADer CONTROL sets the Sync<br>header type of custom pattern search 1 to control.                                          |

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CHEADer? might return  
:SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CHEADer DATA, indicating the  
Sync Header of custom pattern for search 1 is set to data.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:DHEADer

This command sets or queries the data pattern to trigger on. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPCIE321                                                                                                                                                                                                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:DHEADer <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:DHEADer?                                                                                                                                                                                                                    |
| <b>Arguments</b>  | <QString> specifies the binary block data string.                                                                                                                                                                                                                                                                                      |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTom:DHEADer "000000011"<br>sets the custom data pattern for search 1 to 000000011.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTom:DHEADer? might return<br>:SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTom:DHEADer "00000001",<br>indicating that custom data pattern for search 1 is set to 00000001. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:NSYMBOLs

This command sets or queries the number of symbols in custom pattern to trigger on. The search number is specified by x.

|                   |                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPCIE321                                                                                         |
| <b>Group</b>      | Search and Mark                                                                                                   |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:NSYMBOLs <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:CUSTom:NSYMBOLs? |
| <b>Arguments</b>  | <NR1> specifies the data string in a valid format. The minimum and default values are 0. The maximum value is 16. |

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTOM:NSYMBOLs 4 sets the number of symbols in custom pattern for search 1 to 4.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTOM:NSYMBOLs? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:CUSTOM:NSYMBOLs 5, indicating that number of symbols in custom pattern for search 1 is set to 5.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue

This command sets or queries the data value to be used for DLLP Flow control when triggering on a PCIe bus signal. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue?

**Arguments** <NR1> specifies the data string in a valid format. The minimum and default values are 0. The maximum value is 4095.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue 4 sets the Data value of DLLP for search 1 to 4.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:DCRedits:VALue 34, indicating that Data value of DLLP for search 1 is set to 34.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:HCRedits:VALue

This command sets or queries the header credits to be used for DLLP Flow control when triggering on a PCIe bus signal. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:HCRedits:VALue <NR1>

SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:HCReditS:VALue?

**Arguments** <NR1> specifies the data string in a valid format. The minimum and default values are 0. The maximum value is 4095.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:HCReditS:VALue 4 sets the Header Credit value of DLLP for search 1 to 4.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:HCReditS:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:HCReditS:VALue 34, indicating that Header Credit value of DLLP for search 1 is set to 34.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue

This command sets or queries the virtual channel to be used for DLLP Flow control when triggering on a PCIe bus signal. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue  
<NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue?

**Arguments** <NR1> specifies the data string in a valid format. The minimum and default values are 0. The maximum value is 4095.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue 4 sets the Virtual channel value of DLLP for search 1 to 4.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:DLLP:VCHANnel:VALue 34, indicating that Virtual channel value of DLLP for search 1 is set to 34.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:OSETtype

This command sets or queries the ordered set trigger condition for a PCIe bus. The search number is specified by x.

**Conditions** Requires option SRPCIE321

|                  |                                                                                                                                                                                                                                                                                                                                      |

| <b>Arguments</b> | TS1 specifies the search condition as TS1.<br>TS2 specifies the search condition as TS2.<br>EIOS specifies the search condition as EIOS.<br>EIEOS specifies the search condition as EIEOS.<br>FTS specifies the search condition as FTS.<br>SDS specifies the search condition as SDS.<br>SKP specifies the search condition as SKP. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:OSETtype TS1 sets the PCIe bus trigger search 1 to TS1.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:OSETtype? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:OSETtype EIOS, indicating Ordered set type for search 1 is set to EIOS.                                                                 |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:SYNC

This command sets or queries the Sync header type to trigger on a PCIe Gen 3. The search number is specified by x.

|                   |                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPCIE321                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:SYNC<br>{ORDSET DATA INVALID}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:SYNC?                                         |
| <b>Arguments</b>  | ORDSET specifies the search condition as ORDSET.<br>DATA specifies the search condition as DATA.<br>INVALID specifies the search condition as INVALID. |

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:SYNC ORDSET sets the Sync header type search 1 to ORDSET.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:SYNC? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:SYNC DATA, indicating the Sync Header type for search 1 is set to DATA.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE

The command sets or queries the trigger condition for Address Mode of TLP in PCIe bus. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE {ADDR32|ADDR64}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE?

**Arguments** ADDR32 specifies the search condition as ADDR32.  
ADDR64 specifies the search condition as ADDR64.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE ADDR32 sets the TLP Address mode search 1 to ADDR32.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:ADDRess:MODE ADDR64, indicating the Address mode for search 1 is set to ADDR64.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:AHIGH

This command sets the binary data value to be used for Address High of TLP when triggering on a PCIe bus signal. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:MCODe

This command sets the binary data value to be used for Message Code of TLP when triggering on a PCIe bus signal. The search number is specified by x.

|                   |                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPCIE321                                                                                 |
| <b>Group</b>      | Search and Mark                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:MCODe <Qstring><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:MCODe? |

**Arguments** <QString> specifies the binary block data string.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:MCode "000000011" sets the Message Code of TLP for search 1 to 000000011.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:MCode? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:MCode "00000001", indicating that the Message Code of TLP for search 1 is set to 00000001.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:PREFix

This command sets the binary data value to be used for Prefix of TLP when triggering on a PCIe bus signal. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:PREFix <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:PREFix?

**Arguments** <QString> specifies the binary block data string.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:PREFix "0010" sets the Prefix of TLP for search 1 to 0010.

SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:PREFix? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PCIE:TLP:PREFix "0001", indicating that the Prefix of TLP for search 1 is set to 0001.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PCIE:TLP:PTYPe

This command sets or queries the trigger condition for Prefix Type of TLP in PCIe bus. The search number is specified by x.

**Conditions** Requires option SRPCIE321

**Group** Search and Mark

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:BLOCKDATA:VALue

This command sets or queries the binary block data string used for PSI5 triggering if the trigger condition is block id.

|                   |                                                                                                                                                                                                                                                                                                                                                                                 |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:CONDition

This command sets or queries the trigger condition for an PSI5 bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                                                                                                                                                    |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:CONDition<br>{START  STATUS  DATA  BLOCKid  ERRors  STARTBIT <br>FUNCTIONCODE  ECUDATA  SENSORADDRESS  REGISTERADDRESS <br>SENSORSTATUS CRCError}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:CONDition?                                                              |
| <b>Arguments</b>  | START specifies the search condition as Start. This is the default trigger.<br><br>STATUS specifies the search condition as Status.<br><br>DATA specifies the search condition as Data.<br><br>BLOCKid specifies the search condition as Block ID.<br><br>ERRors specifies the search condition as Errors. |

STARTBIT specifies the search condition as Start Bit.

FUNCTIONCODE specifies the search condition as Function Code.

ECUDATA specifies the search condition as ECU Data.

SENSORADDRESS specifies the search condition as Sensor Address.

REGISTERADDRESS specifies the search condition as Register Address.

SENSORSTATUS specifies the search condition as Sensor Status.

CRCERROR specifies the search condition as CRC Error.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:CONDITION START specifies start as the field within a PSI5 frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:CONDITION? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:CONDITION START, indicating that start is the currently specified field within a PSI5 frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue

This command sets or queries the binary Data string used for PSI5 triggering if the trigger condition is Data in ECU to Sensor communication mode. The search number is specified by x.

|                   |                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                                  |
| <b>Group</b>      | Search and Mark                                                                                                                                                                          |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue?                                                  |
| <b>Arguments</b>  | <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.                |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue "01111001" sets the data value as "01111001".<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue? might return |

:SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:DATA:ECU:SENsOr:VALue  
"0111100111", indicating that the data value is "0111100111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:REGion:A:VALue

This command sets or queries the binary data string used for PSI5 triggering if the trigger condition is data region A. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                                                                                                                                                                      |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                              |

| <b>Arguments</b>  | <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.                                                                                                                                                    |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGion:A:VALue<br>"0111100111" sets the data value as "0111100111".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGion:A:VALue?<br>might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGion:A:VALue<br>"0111100111", indicating that the data value is "0111100111". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:REGion:B:VALue

This command sets or queries the binary data string used for PSI5 triggering if the trigger condition is data region B. The search number is specified by x.

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                |
| <b>Group</b>      | Search and Mark                                                                                                                        |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:REGion:B:VALue<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATA:REGion:B:VALue? |

**Arguments** <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGION:B:VALUE "0111100111" sets the data value as "0111100111".

SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGION:B:VALUE? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATA:REGION:A:VALUE "0111100111", indicating that the data value is "0111100111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATABITS

This command sets or queries the binary register address string used for PSI5 triggering if the trigger condition is Data in ECU to Sensor communication mode. The search number is specified by x.

**Conditions** Requires option SR-PSI5

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATABITS  
{FOURBIT|EIGHTBIT|TWENTYBIT}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:DATABITS?

**Arguments** FOURBIT specifies the data bit value as 4 bit.  
EIGHTBIT specifies the data bit value as 8 bit.  
TWENTYBIT specifies the data bit value as 20 bit.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATABITS FOURBIT specifies sets data bit as 4 bit.

SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATBITS? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:DATBITS EIGHTBIT, indicating that the data bit is 8 bit.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:ERRORTYPE

This command sets or queries the error type for an PSI5 bus. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                                                                                                                                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:ERRORTYPE<br>{ANY PARi ty CRC RESPONSECODE}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:ERRORTYPE?                                                                                                                                                                                                     |
| <b>Arguments</b>  | ANY specifies the error type value as any. This is the default value.<br>PARi ty specifies the error type value as parity.<br>CRC specifies the error type value as CRC.<br>RESPONSECODE specifies the error type value as response code.                                                                                                   |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:ERRORTYPE PARi ty specifies parity as the field within a PSI5 frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:ERRORTYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:ERRORTYPE PARi ty, indicating that parity is the current specified field within a PSI5 frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:FUNCTIONCODETYPE

This command sets or queries the binary data string used for PSI5 triggering if the trigger condition is a Function Code. The search number is specified by x.

|                   |                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:FUNCTIONCODETYPE<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:FUNCTIONCODETYPE?                                          |
| <b>Arguments</b>  | <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format. |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:FUNCTIONCODETYPE "011" specifies function code as "011".                                                                             |

SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:FUNCTIONCODETYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:FUNCTIONCODETYPE "011", indicating that Function Code Type is currently "011".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue

This command sets or queries the binary register address string used for PSI5 triggering if the trigger condition is Register Address. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-PSI5                                                                                                                                                                                                                                                                                                             |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue?                                                                                                                                                                                           |
| <b>Arguments</b>  | <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.                                                                                                                                                           |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue "0111100111" sets the register address value as "0111100111".<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue? might return :SEARCH:SEARCH1:TRIGger:A:BUS:PSIFIVE:REGister:ADDRess:VALue "011", indicating that the register address value is "011". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGISTERADDRess

This command sets or queries the register address for PSI5 bus. The search number is specified by x.

|                   |                         |
|-------------------|-------------------------|
| <b>Conditions</b> | Requires option SR-PSI5 |
| <b>Group</b>      | Search and Mark         |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGISTERADDRESS  
 {TWOBIT|SIXBIT|EIGHTBIT}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:REGISTERADDRESS?

**Arguments** TWOBIT specifies the register address value as 2 bit. This is the default value.  
 SIXBIT specifies the register address value as 6 bit.  
 EIGHTBIT specifies the register address value as 8 bit.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:REGISTERADDRESS SIXBIT  
 specifies the register address as 6 bit as the field within a PSI5 frame to search on.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:REGISTERADDRESS? might  
 return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:REGISTERADDRESS  
 SIXBIT, indicating that register address as 6 bit is the currently specified field  
 within a PSI5 frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue

This command sets or queries the binary sensor address string used for PSI5 triggering if the trigger condition is Sensor Address. The search number is specified by x.

**Conditions** Requires option SR-PSI5

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue  
 <Qstring>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue?

**Arguments** <Qstring> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue  
 "101" specifies sensor address as "101".  
 SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue?  
 might return  
 :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSor:ADDRESS:VALue  
 "101", indicating that the sensor address value is currently "101".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSORSTaTus:TYPe

This command sets or queries the sensor status for PSI5 bus.

**Conditions** Requires option SR-PSI5

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSORSTaTus:TYPe  
{READY|BUSY|DEFect|SERVICEMODE|UNLocked}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:SENSORSTaTus:TYPe?

**Arguments** READY specifies the sensor status as ready. This is the default value.  
BUSY specifies the sensor status as busy.  
DEFect specifies the sensor status as defect.  
SERVICEMODE specifies the sensor status as service mode.  
UNLocked specifies the sensor status as unlocked.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSORSTaTus:TYPe READY  
specifies ready as the field within a PSI5 frame to search on.  
SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSORSTaTus:TYPe? might  
return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:SENSORSTaTus:TYPe  
READY, indicating that ready is the specified field within a PSI5 frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:STaTus:VALue

This command sets or queries the binary status string used for PSI5 triggering if the trigger condition is status.

**Conditions** Requires option SR-PSI5

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:STaTus:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:PSIFIVE:STaTus:VALue?

**Arguments** <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:STATUS:VALUE "10" specifies the status value as "10".

SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:STATUS:VALUE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:PSIFIVE:STATUS:VALUE "10", indicating that the status value is 10.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:CONDition

This command sets or queries the condition for an RS232C bus search to determine where to place a mark. The search number is specified by x.

**Conditions** Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:CONDition  
{DATA|EOP|PARITyerror|START}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:CONDition?

**Arguments** DATA specifies the search condition as Data.  
EOP specifies the search condition as End of Packet.  
PARITyerror specifies the search condition as Parity Error.  
START specifies the search condition as Start.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:RS232C:CONDITION DATA sets the search condition for RS232C bus trigger search 1 to Data.

SEARCH:SEARCH2:TRIGGER:A:BUS:RS232C:CONDITION? might return :SEARCH:SEARCH2:TRIGGER:A:BUS:RS232C:CONDITION EOP, indicating that the search condition for RS232C bus trigger search 2 is set to End of Packet.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:SIZE

This command sets or queries the length of the data string in bytes to be used for an RS232 bus search to determine where to place a mark when the search condition is Data. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.                                                                                                                                                                                                                                                          |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                       |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:SIZE <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:SIZE?                                                                                                                                                                                                                             |
| <b>Arguments</b>  | <NR3> is the number of bits per word in the data string, from 1 to 8.                                                                                                                                                                                                                                                                 |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:RS232C:DATA:SIZE 1 sets the number of bits per word in RS232C bus trigger search 1 data string to 1.<br><br>SEARCH:SEARCH2:TRIGGER:A:BUS:RS232C:DATA:SIZE? might return :SEARCH:SEARCH2:TRIGGER:A:BUS:RS232C:DATA:SIZE 8, indicating that the bits per word for RS232C bus trigger search 2 is set to 8. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:VALue

This command sets or queries the data string used for the specified RS232C bus trigger search to determine where to place a mark. The search condition must be Data. The search number is specified by x.

|                   |                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:RS232C:DATA:VALue?                                                           |
| <b>Arguments</b>  | <QString> specifies the value of the data string. The valid characters are 0, 1, and X for values in binary format; and A-F, 0-9, and X for values in hexadecimal format. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:RS232C:DATA:VALUE "01"` sets the value of the data string for RS232C bus trigger search 1 to "01" when the format is hexadecimal.

`SEARCH:SEARCH1:TRIGGER:A:BUS:RS232C:DATA:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:RS232C:DATA:VALUE "XXXXXXX1"`, indicating that the data string value for RS232C bus trigger search 1 is set to "XXXXXXX1" when the format is binary.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition

This command sets or queries the type of data search for an 8B10B bus. The search number is specified by x.

**Conditions**     Requires the SR8B10b Triggering and Analysis application.

**Group**            Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition`  
                           `{SYMBOLs|ERRORs}`  
                           `SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:DISParity](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:ERRor](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:CSYMVALue](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:EBITVALue](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:MODE](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TBITVALue](#)  
                                   [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TYPE](#)

**Arguments**        `SEARCH<x>` is the number of the search.

`SYMBOLs` specifies the search condition as data or control.

`ERRORs` specifies the search condition as Symbol error or disparity error.

**Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:CONDition SYMBOL` specifies Symbol as the field within an 8B10b frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:CONDITION? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:CONDITION SYMBOL,  
indicating that SYMBOL is the currently specified field within an 8B10b frame  
to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:DISParity

This command sets or queries the disparity to be used when searching on a 8B10b signal. The search condition must be set to Symbols > 8-bit.

**Conditions** Requires the SR8B10b Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:DISParity  
{POSITIVE|NEGAtive|EITHer}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:DISParity?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition](#)

**Arguments** SEARCH<x> is the Search identifier number.  
POSITIVE specifies searching for positive disparity.  
NEGAtive specifies searching for negative disparity.  
EITHer specifies searching for neutral or either positive/negative disparity.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:DISParity POSITIVE sets  
the disparity to positive.

SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:DISParity? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:DISParity POSITIVE,  
indicating the disparity is positive.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:ERRor

This command sets or queries the error type to be used when searching on a 8B10b signal. The search condition must be set to Errors.

**Conditions** Requires the SR8B10b Triggering and Analysis application.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:CSYMVALue

This command sets or queries the control symbol value to be used when searching on 8b10b signal. The default is all X's (don't care). The search condition needs to be set to Symbols. The search number is specified by x.

|                         |                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires the SR8B10b Triggering and Analysis application.                                                                      |
| <b>Group</b>            | Search and Mark                                                                                                                |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:CSYMVALue<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:CSYMVALue? |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:S8B10B:CONDition</a>                                                          |
| <b>Arguments</b>        | SEARCH<x> is the Search identifier number.<br><br><QString> specifies the 10 bit value.                                        |

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:CSYMVALue "D28.5" specifies the value to be used while searching.

SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:CSYMVALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:SYMbo1:CSYMVALue "D28.5", indicating the value to be used while searching.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMbol:EBITVALue

This command specifies the 8 bit value to be used when searching on an 8b10b signal. The default is all X's (don't care). The search condition needs to be set to Symbols. The search number is specified by x.

**Conditions** Requires the SR8B10b Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMbo1:EBITVALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMbo1:EBITVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition](#)

**Arguments** SEARCH<x> is the Search identifier number.  
<QString> specifies the 8 bit value.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:EBITVALue "00001000" specifies hexadecimal 08 as the value to be used while searching.

SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:EBITVALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:SYMbo1:EBITVALue "00001000", indicating the binary value and 08 as the hexadecimal value to be used while searching.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMbol:MODE

This command sets or queries the mode of data search to be used when searching on 8b10b signal. The search condition must be set to Symbols.

**Conditions** Requires the SR8B10b Triggering and Analysis application.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TBITVALue

This command specifies the 10 bit value to be used when searching on an 8b10b signal. The default is all X's (don't care). The search condition needs to be set to Symbols. The search number is specified by x.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TYPE

This command sets or queries the type of symbol when searching on 8b10b signal. The search condition must be set to Symbols.

|                   |                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires the SR8B10b Triggering and Analysis application.                                                                 |
| <b>Group</b>      | Search and Mark                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TYPE<br>{DATA CONTRol}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:SYMBOL:TYPE? |

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:S8B10B:CONDition](#)

**Arguments**    SEARCH<x> is the number of the search.  
 DATA specifies searching for Data Symbols.  
 CONTro1 specifies searching for Control Symbols.

**Examples**    SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:TYPE DATA sets the symbol type to data.  
 SEARCH:SEARCH1:TRIGger:A:BUS:S8B10B:SYMbo1:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:S8B10B:SYMbo1:TYPE DATA, indicating the symbol type to be data.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:ADDRESS:TYPE

This commands specifies the Address type in SDLC frame which can be Broadcast, No-Station and Address value can be specified.

**Conditions**    Requires option SR-SDLC.

**Group**    Search and Mark

**Syntax**    SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:ADDRESS:TYPE  
 {BROadcast|NOSTATIon|STATIONADDR}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:ADDRESS:TYPE?

**Arguments**    SEARCH<x> is the number of the search.  
 BROadcast specifies the Broadcast as the field within a SDLC frame to search on. BROadcast is the default value.  
 NOSTATIon specifies the No-Station as the field within a SDLC frame to search on.  
 STATIONADDR specifies the Address as the field within a SDLC frame to search on.

**Examples**    SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ADDRESS:TYPE BROadcast specifies the Address Type as the field within a SDLC frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ADDRESS:TYPE? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ADDRESS:TYPE BROADCAST,  
indicating that the Address Type is specified as Broadcast.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:SDLC:CONDITION

This command sets or queries the trigger condition for a SDLC bus.

**Conditions** Requires option SR-SDLC.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:SDLC:CONDITION {START| DATA|  
ABORT| ADDRESS| UNNUMBERED| INFORMATION| SUPERVISORY|  
ERRORS| END}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:SDLC:CONDITION?

**Arguments** SEARCH<x> is the number of the search.

START specifies start as the field within a SDLC frame to search on. The default  
Trigger on Condition is START.

DATA specifies data as the field within a SDLC frame to search on.

ABORT specifies abort as the field within a SDLC frame to search on.

ADDRESS specifies address as the field within a SDLC frame to search on.

UNNUMBERED specifies unnumbered as the field within a SDLC frame to search on.

INFORMATION specifies information as the field within a SDLC frame to search  
on.

SUPERVISORY specifies supervisory as the field within a SDLC frame to search on.

ERRORS specifies errors as the field within a SDLC frame to search on.

END specifies end as the field within a SDLC frame to search on.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:CONDITION START specifies start  
as the field within a SDLC frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:CONDITION? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:CONDITION START, indicating  
that start is the currently specified field within a SDLC frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:SIZE

This command specifies the length of the data string in bytes to be used for SDLC triggering if the trigger condition is DATA. The search number is specified by x.

|                   |                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                                                                                                                                                |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                         |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:SIZE <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:SIZE?                                                                                                                                   |
| <b>Arguments</b>  | <NR3> is the length of the data string in bytes. The default Data size is 1, otherwise ranges between 1 to 5.                                                                                                                           |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:SIZE 4 sets the data size value as 4.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:SIZE 4, indicating that the data size value is 4. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:VALue

This command specifies the binary data string used for SDLC triggering if the trigger condition is DATA. The search number is specified by x.

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                    |
| <b>Group</b>      | Search and Mark                                                                                             |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:DATA:VALue? |
| <b>Arguments</b>  | <QString> specifies the value of the data string. The default value is XXXXXXXX .                           |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:VALue "0111100111" sets the Data value as "0111100111".              |

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:VALUE? might return  
:SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:DATA:VALUE "0111100111",  
indicating that the data value is "0111100111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:ERROR:TYPE

This command sets or queries the Error Type in SDLC bus.

|                   |                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                                                                                                                                                                                                                                            |

| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br>FCS sets FCS as the Error Type in SDLC bus. The default error type condition is FCS<br><br>NUMERICORDER sets NUMERICORDER as the Error Type in SDLC bus.                                                                                                                              |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ERROR:TYPE FCS specifies parity<br>as the field within a FCS frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ERROR:TYPE? might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:ERROR:TYPE FCS, indicating that<br>FCS is the currently specified field within a FCS frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:FRAME:TYPE

This command sets or queries the Frame Type in SDLC bus.

|                   |                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                              |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:FRAME:TYPE<br>{COMMAND RESPONSE BOTH}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:FRAME:TYPE? |

**Arguments** SEARCH<x> is the number of the search.

COMMAND sets Command as the Frame Type in SDLC bus. The default value of frame type for SDLC Unnumbered frame is Command.

RESPONSE sets Response as the Frame Type in SDLC bus.

BOTH sets both Command and Response as the Frame Type in SDLC bus.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:FRAME:TYPE RESPONSE specifies the frame type as Response.

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:FRAME:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:FRAME:TYPE RESPONSE, indicating that frame type is Response for Unnumbered frames and accordingly packet list will change.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:STADdress:VALue

This command specifies the binary Station Address string used for SDLC triggering if the trigger condition is Address. The search number is specified by x.

**Conditions** Requires option SR-SDLC.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:STADdress:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:STADdress:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:ADDRess:TYPE](#)

**Arguments** <QString> specifies the value of the data string. The default value is XXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:STADdress:VALue "0111100111" sets the Station Address value as "0111100111".

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:STADdress:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:STADdress:VALue "0111100111", indicating that the station address value is "0111100111".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:SUPervisory:FRAMETYPe

This command sets or queries the Supervisory Frame Type in SDLC bus.

|                   |                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                                                                                                                                                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:SUPervisory:FRAMETYPe<br>{RR RNR REJ}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:SUPervisory:FRAMETYPe?                                                                                                                                                                                                                         |
| <b>Arguments</b>  | SEARCH<x> is the number of the search.<br><br>RR sets the frame type as RR.<br><br>RNR sets the frame type as RNR.<br><br>REJ sets the frame type as REJ.                                                                                                                                                                                                       |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:SUPervisory:FRAMETYPe RNR<br>specifies Receive Not Ready supervisory packet type.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:SUPervisory:FRAMETYPe?<br>might return<br>:SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:SUPervisory:FRAMETYPe RNR,<br>indicating that RNR is the currently specified SDLC Supervisory Packet<br>to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:UNNumbered:FRAMETYPe

This command sets or queries the Unnumbered Frame Type in SDLC bus.

|                   |                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SDLC.                                                                                                                                                                                                  |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:UNNumbered:FRAMETYPe<br>{UP UI SNRM SNRME REQDISconnect UACK REQSETINIT <br>DISCMODE FRAMEREJ TEST XID CONFigure BEACon}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:UNNumbered:FRAMETYPe? |

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:SDLC:FRAMe:TYPE](#)

**Arguments**

SEARCH<x> is the number of the search.

UP sets the Unnumbered Frame Type as UP.

UI sets the Unnumbered Frame Type as UI.

SNRM sets the Unnumbered Frame Type as SNRM.

SNRME sets the Unnumbered Frame Type as SNRME.

REQDISConnect sets the Unnumbered Frame Type as REQDISConnect.

UACK sets the Unnumbered Frame Type as UACK.

REQSETINIT sets the Unnumbered Frame Type as REQSETINIT.

DISCMODE sets the Unnumbered Frame Type as DISCMODE.

FRAMEREJ sets the Unnumbered Frame Type as FRAMEREJ.

TEST sets the Unnumbered Frame Type as TEST.

XID sets the Unnumbered Frame Type as XID.

CONFiGure sets the Unnumbered Frame Type as CONFiGure.

BEACon sets the Unnumbered Frame Type as BEACon.

**Examples**

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:UNNumbered:FRAMETYPE SNRME specifies the frame type as SNRME.

SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:UNNumbered:FRAMETYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SDLC:UNNumbered:FRAMETYPE SNRME, indicating that Unnumbered Frame type is SNRME when related command Frame Type is set as COMManD.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition

This command sets or queries the search condition for a SENT bus.

**Conditions**    Requires option SRAUTOSEN.

**Group**    Search and Mark

**Syntax**    SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition  
 {START|FAST|SLOW|PAUSE|ERROR}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition?

|                  |                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | SEARCH<x> is the number of the search.<br>START specifies searching for start of packet.<br>FAST specifies searching for fast channel data.<br>SLOW specifies searching for slow channel data.<br>PAUSE specifies searching for pause pulses.<br>ERROR specifies searching on errors. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:CONDITION SLOW specifies searching for slow channel packet.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:CONDITION? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:CONDITION PAUSE, indicating the search is set to find pause pulses.                  |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType

This command sets or queries the error type to be used when searching on SENT data.

|                         |                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SRAUTOSEN.<br>SENT bus trigger condition is set to ERRor.                                                                          |
| <b>Group</b>            | Search and Mark                                                                                                                                    |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType<br>{FRAMELENGTH CRC}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType?                                   |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SENT:CONDition</a>                                                                                |
| <b>Arguments</b>        | SEARCH<x> is the number of the search.<br>FRAMELENGTH specifies searching for SENT frame length errors.<br>CRC specifies searching for CRC errors. |
| <b>Examples</b>         | SEARCH:SEARCH1:TRIGger:A:BUS:SENT:ERRType FRAMELENGTH sets the search to find SENT frame length errors.                                            |

SEARCH:SEARCH1:TRIGger:A:BUS:SENT:ERRType? might return  
SEARCH:SEARCH1:TRIGger:A:BUS:SENT:ERRType CRC to indicate the  
search is set to find CRC errors.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType:CRc

This command sets or queries the CRC error type to be used when searching on SENT data.

|                   |                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRAUTOSEN.<br>SENT bus trigger condition is set to ERRor and ERRType is set to CRC.             |
| <b>Group</b>      | Search and Mark                                                                                                 |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType:CRc {FAST SLOW}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType:CRc? |

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:ERRType](#)

|                  |                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | SEARCH<x> is the number of the search.<br>FAST specifies searching for CRC errors only in the fast channel.<br>SLOW specifies searching for CRC errors only in the slow channel. |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Examples**    SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:ERRType:CRc SLOW sets the search to find SENT slow channel CRC errors.  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:ERRType:CRc? might return  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:ERRType:CRc FAST, indicating that the SENT fast channel is being searched for CRC errors.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:HIVALue

This command sets or queries the high binary fast channel 1 value to use when searching on a SENT bus signal.

|                   |                                                                                  |
|-------------------|----------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRAUTOSEN.<br>The SENT bus search condition must be set to FAST. |
|-------------------|----------------------------------------------------------------------------------|

| <b>Group</b>            | Search and Mark                                                                                                                                                                                        |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:<br>QUALifier {Equal UNEQual LESSthan MORethan <br>LESSEQual MOREEQual INrange OUTrange}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:QUALifier? |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SENT:CONDition</a><br><br><a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SENT:FAST:CHAN1A:VALue</a>                                                 |

**Arguments** SEARCH<x> is the number of the search.  
 Equal specifies the qualifier as Equal.  
 LESSEqual specifies the qualifier as Less Than or Equal to.  
 LESSthan specifies the qualifier as Less Than.  
 MOREEqual specifies the qualifier as More Than or Equal to.  
 MOREthan specifies the qualifier as More Than.  
 UNEqual specifies the qualifier as Unequal.  
 INrange sets the qualifier to inside a range.  
 OUTrange sets the qualifier to outside a range.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN1A:QUALIFIER  
 UNEQUAL sets the fast channel 1 data qualifier to not equal for search 1.  
 SEARCH:SEARCH3:TRIGGER:A:BUS:SENT:FAST:CHAN1A:QUALIFIER?  
 might return  
 SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN1A:QUALIFIER  
 MOREEQUAL to indicate that the fast channel 1 data qualifier is set  
 to greater than or equal for search 3.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:VALue

This command sets or queries the binary fast channel 1 value to be used when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
 The trigger condition must be set to FAST.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:VALue  
 <QString>  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN1A:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the number of the search.  
 <QString> is the Fast Channel 1 binary value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN1A:VALUE  
"XXXXXXXXXXXX" sets the Fast Channel 1 value to XXXXXXXXXXXXXXX, or  
"don't care."  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN1A:VALUE? might  
return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN1A:VALUE  
"0000XXXX1111" to indicate the binary value 0000XXXX1111.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN2B:HIVALue

This command sets or queries the high binary fast channel 2 value to use when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.

The SENT bus search condition must be set to FAST.

**Group** Trigger

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN2B:HIVALue  
<Qstring>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN2B:HIVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the Search identifier number.  
<Qstring> sets the Fast Channel 2 high binary data value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN2B:HIVALue  
"100000000000" sets the Fast Channel 2 high value on which to search to  
100000000000.  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN2B:HIVALue? might  
return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:CHAN2B:HIVALUE  
"0101XXXX1111", indicating the Fast Channel 2 high value on which to search is  
set to the binary value 0101XXXX1111.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:CHAN2B:QUALifier

This command sets or queries the qualifier to be used when searching on SENT fast packet bus data for device channel 2.

[BUS:B<x>:SENT:NUMCHANnel](#)

[BUS:B<x>:SENT:NIBBLECount](#)

**Arguments** SEARCH<x> is the Search identifier number.  
 <QString> sets the Fast Channel 1 counter binary value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:HIVALUE  
 "XXXXXXXX" sets the Fast Channel secure counter high value on which to search  
 to "don't care."  
 SEARCH:SEARCH4:TRIGGER:A:BUS:SENT:FAST:COUNTER:HIVALUE? might  
 return SEARCH:SEARCH4:TRIGGER:A:BUS:SENT:FAST:COUNTER:HIVALUE  
 "11110000" to indicate a binary value of 11110000 on which to search.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:QUALifier

This command sets or queries the qualifier to be used when searching on SENT fast packet bus data for the secure format counter.

**Conditions** Requires option SRAUTOSEN  
 The SENT bus trigger condition must be set to FAST.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:  
 QUALifier {Equal|UNEQual|LESSthan|MORThan|  
 LESSEQual|MORREQual|INrange|OUTrange}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:QUALifier?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:VALue](#)

**Arguments** SEARCH<x> is the number of the search.  
 Equal specifies the qualifier as Equal.  
 LESSEQual specifies the qualifier as Less Than or Equal to.  
 LESSthan specifies the qualifier as Less Than.  
 MORREQual specifies the qualifier as More Than or Equal to.

**MOREthan** specifies the qualifier as More Than.

**UNEQUAL** specifies the qualifier as Unequal.

**INrange** sets the qualifier to inside a range.

**OUTrange** sets the qualifier to outside a range.

**Examples**    `SEARCH:SEARCH5:TRIGGER:A:BUS:SENT:FAST:COUNTER:QUALIFIER`  
`LESSThan` sets the fast channel 2 data qualifier on search 5 to less than.

`SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:QUALIFIER?`  
might return  
`SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:QUALIFIER`  
`EQUAL` to indicate that the fast channel 2 data qualifier on search 1 is set to equal.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:VALue**

This command sets or queries the binary fast message counter value to be used when searching on a SENT bus signal.

**Conditions**    Requires option SRAUTOSEN.  
The search condition must be set to FAST.  
The number of channels must be set to 1.  
The nibble count must be set to 6.

**Group**        Search and Mark

**Syntax**       `SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:VALue`  
`<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:COUNTER:VALue?`

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)  
[BUS:B<x>:SENT:NIBBLECount](#)  
[BUS:B<x>:SENT:NUMCHANnel](#)

**Arguments**    `SEARCH<x>` is the number of the search.  
`<QString>` is the Fast Channel 1 counter value.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:VALUE "XXXXXXXX"` sets the Fast Channel 1 secure counter value to "don't care."

`SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:COUNTER:VALUE "00001111"` to search for a binary counter value of 00001111.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:INVERTNIBble:VALue**

This command sets or queries the binary fast message inverted nibble value to be used when searching on a SENT bus signal.

**Conditions**     Requires option SRAUTOSEN.

The search condition must be set to FAST.

The number of channels must be set to 1.

The nibble count must be set to 6.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:INVERTNIBble:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:INVERTNIBble:VALue?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)  
[BUS:B<x>:SENT:NIBBLECount](#)  
[BUS:B<x>:SENT:NUMCHANnel](#)

**Arguments**     `SEARCH<x>` is the number of the search.  
`<QString>` is the fast message inverted nibble binary value.

**Examples**     `TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE "XXXX"` sets the Fast Channel 1 secure inverted nibble value to "don't care."

`TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE?` might return `TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE "1111"` to search for a binary inverted nibble value of 1111.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:STATus:VALue

This command sets or queries the binary status value to be used when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.

The trigger condition must be set to FAST.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:STATus:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:FAST:STATus:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the number of the search.

<QString> is the binary status binary value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:STATus:VALue "XXXX"  
sets the binary status value to XXXX.

SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:STATus:VALue? might  
return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:FAST:STATus:VALue  
"1010" to indicate searching on a binary status value of 1010.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:QUALifier

This command sets or queries the qualifier to be used when searching on SENT pause pulses.

**Conditions** Requires option SRAUTOSEN

The SENT bus trigger condition must be set to PAUSE.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:  
QUALifier {EQUAL|UNEQUAL|LESSTHAN|MORETHAN|  
LESSEQUAL|MOREEQUAL|INRANGE|OUTRANGE}

SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:QUALifier?

**Related Commands**

[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:VALue](#)

[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:HIVALue](#)

**Arguments**

SEARCH<x> is the number of the search.

Equal specifies the qualifier as Equal.

INrange sets the qualifier to be within a range.

LESSEqual sets the qualifier as Less Than or Equal to.

LESSthan sets the qualifier as Less Than.

MOREEqual sets the qualifier as More Than or Equal to.

MOREthan sets the qualifier as More Than.

OUTrange sets the qualifier to be outside a range.

UNEQual specifies the qualifier as Unequal.

**Examples**

SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:QUALIFIER LESSTHAN sets the pause pulse qualifier to less than.

SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:QUALIFIER? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:QUALIFIER INRANGE to indicate that the pause pulse qualifier is set to search inside the range of ticks low and ticks high.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:HIVALue

This command sets or queries the maximum number of pause clock ticks to be used when searching on a SENT bus signal.

**Conditions**

Requires option SRAUTOSEN.

The trigger condition must be set to PAUSE.

**Group**

Search and Mark

**Syntax**

SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:HIVALue

SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:HIVALue ?

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments**    SEARCH<x> is the number of the search.  
<NR1> is the maximum number of pause clock ticks to be used when searching.

**Examples**    SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:HIVALUE 15 sets the maximum pause tick count for which to search to 15.  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:HIVALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:HIVALUE 20 to indicate the maximum number of pause ticks to search for is 20.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:VALue

This command sets or queries the minimum number of pause clock ticks to be used when searching on a SENT bus signal.

**Conditions**    Requires option SRAUTOSEN.  
The trigger condition must be set to PAUSE.

**Group**    Search and Mark

**Syntax**    SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKS:VALue <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKS:VALue?

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments**    SEARCH<x> is the number of the search.  
<NR1> is the minimum number of pause clock ticks to be used when searching.

**Examples**    SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:VALUE 12 sets the minimum pause tick count on which to search to 12.  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:PAUSE:TICKS:VALUE 15 to indicate the minimum number of pause ticks to search for is 15.

**SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:HIVALue**

This command sets or queries the high binary Slow channel data value to use when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.

The SENT bus search condition must be set to SLOW.

**Group** Trigger

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:HIVALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:HIVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the Search identifier number.

<QString> sets the binary Slow channel data value.

**Examples** SEARCH:SEARCH2:TRIGGER:A:BUS:SENT:SLOW:DATA:HIVALUE  
"XXXXXXXX" sets the Slow data high value on which to search to "don't care"  
for Search 2.

SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:HIVALUE? might  
return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:HIVALUE  
"11110001", to indicate searching on slow data values that match 11110001.

**SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:QUALifier**

This command sets or queries the qualifier to be used when searching on SENT slow packet bus data.

**Conditions** Requires option SRAUTOSEN.

The SENT bus trigger condition must be set to SLOW.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:QUALifier {Equal|UNEQua1|LESSthan|MOREthan|LESSEQua1|MOREEQua1|INrange|OUTrange}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:QUALifier?

**Related Commands** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:VALue

**Arguments** SEARCH<x> is the number of the search.  
Equal specifies the qualifier as Equal.  
LESSEQua1 sets the qualifier as Less Than or Equal to.  
LESSthan sets the qualifier as Less Than.  
MOREEQua1 sets the qualifier as More Than or Equal to.  
MOREthan sets the qualifier as More Than.  
UNEQua1 specifies the qualifier as Unequal.  
INrange sets the search qualifier to inside a range.  
OUTrange sets the search qualifier to outside a range.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:QUALIFIER  
LESSEQUAL sets the slow channel data qualifier to less than or equal.  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:QUALIFIER? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:QUALIFIER EQUAL to indicate that the slow channel data qualifier is set to equal.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:VALue

This command sets or queries the binary slow channel data value to be used when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
The trigger condition must be set to SLOW.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:VALue <Qstring>

SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:DATA:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the number of the search.  
<QString> is the slow channel data binary value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:VALUE "XXXXXXXX" sets the slow data search value to "don't care."  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:DATA:VALUE? might return "XXXX1111", indicating the search is marking slow data values that match XXXX1111.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:IDentifier:VALue

This command sets or queries the binary slow identifier value to be used when searching on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
The trigger condition must be set to SLOW.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:IDentifier:VALue  
<QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:SLOW:IDentifier:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:CONDition](#)

**Arguments** SEARCH<x> is the number of the search.  
<QString> is the slow channel identifier binary value.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:IDENTIFIER:VALUE "XXXX" sets the search identifier value to "don't care."  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:IDENTIFIER:VALUE? might return

SEARCH:SEARCH1:TRIGGER:A:BUS:SENT:SLOW:IDENTIFIER:VALUE  
"0001" indicating to search for the slow channel identifier value of 0001.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:ADDRes:VALue

This command specifies the binary physical address string used for SMBUS triggering if the trigger condition is address.

|                   |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SMBUS                                                                                                                                                                                                                                                                                                                                                         |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:COMManD:VALue

This command specifies the binary command code string used for SMBUS triggering if the trigger condition is command code.

|                   |                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SMBUS                                                                                            |
| <b>Group</b>      | Search and Mark                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:COMManD:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:COMManD:VALue? |

**Arguments** SEARCH<x> is the search identifier number.  
 <QString> specifies the command value as the field within a SMBUS frame to search on. The default value is XXXXXXXX.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:COMMAND:VALUE "11011111" specifies the address value as the field within a SMBUS frame to search on.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:COMMAND:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:COMMAND:VALUE "11011111", indicating the command value as "11011111" current specified within a SMBUS frame to search on.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:SMBUS:CONDITION

This command sets or queries the trigger condition for a SMBUS bus.

**Conditions** Requires option SR-SMBUS

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:SMBUS:CONDITION {START|REPEATSTART| ADDRESS| HOSTADDR| DEVICEADDR| COMMAND| DATA| UDIDDATA| ERROR| STOP| IDLE}  
 SEARCH:SEARCH<x>:TRIGGER:A:BUS:SMBUS:CONDITION?

**Arguments** SEARCH<x> is the search number.  
 START sets the search condition to start. This is the default value.  
 REPEATSTART sets the search condition to repeat start.  
 ADDRESS sets the search condition to address.  
 HOSTADDR sets the search condition to host address.  
 DEVICEADDR sets the search condition to device address.  
 COMMAND sets the search condition to command.  
 DATA sets the search condition to data.  
 UDIDDATA sets the search condition to UDID data.  
 ERROR sets the search condition to error.  
 STOP sets the search condition to stop.  
 IDLE sets the search condition to idle.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:CONDition START specifies start as the event within a SMBUS frame to search on.

SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:CONDition? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:CONDition START, indicating that start is the currently specified event within a SMBUS frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:SIZE

This command specifies the length of the data string in bytes to be used for an SMBus trigger if the trigger condition is DATA.

**Conditions** Requires option SR-SMBUS

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:SIZE?

**Arguments** SEARCH<x> is the search number.  
NR1 sets the data size value. The valid range is 1 to 8. The default data size is 1.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:SIZE 4 sets the data size value as 4.

SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:SIZE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:SIZE 4, indicating that the data size value is 4.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:VALue

This command specifies the binary data string used for SMBus triggering if the trigger condition is DATA.

**Conditions** Requires option SR-SMBUS

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DATA:VALue?

|                  |                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | SEARCH<x> is the search identifier number.<br><br><QString> specifies the data value as the field within a SMBUS frame to search on. The default value is XXXXXXXX.                                                                                                     |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:VALue "11001100" sets the data value as "11001100".<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DATA:VALue "11001100", indicating that the data value is "11001100". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DEVICEADDR:VALue

This command specifies the binary physical address string is used for SMBUS triggering if the trigger condition is device address.

|                   |                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SMBUS                                                                                                                                                                                                                                                                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DEVICEADDR:VALue<br><QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:DEVICEADDR:VALue?                                                                                                                                                                                                                 |
| <b>Arguments</b>  | SEARCH<x> is the search identifier number.<br><br><QString> specifies the device address value as the field within a SMBUS frame to search on. The default value is XXXXXXXX.                                                                                                                                                                |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DEVICEADDR:VALue "0011111" specifies the device Address value as the field within a SMBUS frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DEVICEADDR:VALue? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:DEVICEADDR:VALue "11001100", indicating the device address value is "0011111". |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:ERROR:TYPE

This command sets or queries the error type for a SMBus.

|                   |                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SMBUS                                                                                                                                                                                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                            |

| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:ERROR:TYPE ACK specifies ACK error as the field within a SMBus frame to search on.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:ERROR:TYPE? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:ERROR:TYPE ACK, indicating that ACK error is the currently specified field within a SMBus frame to search on. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:FIELDByte

This command sets or queries the field byte for a SMBUS bus if trigger condition is UDID data.

|                   |                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SMBUS                                                                                                                                  |
| <b>Group</b>      | Search and Mark                                                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:FIELDByte<br>{ONE TWO FOUR}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:FIELDByte?                                       |
| <b>Arguments</b>  | SEARCH<x> is the search number.<br><br>ONE sets the field byte size to 8 bits. This is the default value.<br><br>TWO sets the field byte size to 16 bits. |

FOUR sets the field byte size to 32 bits.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:FIELDByte TWO` sets the field byte size as 16.

`SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:FIELDByte?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:FIELDByte TWO`, indicating that the field byte size is 16.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:UDIDDATa:VALue

This command specifies the binary data string used for SMBUS triggering if the trigger condition is UDID data.

**Conditions**     Requires option SR-SMBUS

**Group**            Search and Mark

**Syntax**          `SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:UDIDDATa:VALue`  
                       `<QString>`  
                       `SEARCH:SEARCH<x>:TRIGger:A:BUS:SMBUS:UDIDDATa:VALue?`

**Arguments**      `SEARCH<x>` is the search identifier number.

`<QString>` specifies the UDID data value as the field within a SMBUS frame to search on. The default value is `XXXXXXXX`.

**Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:UDIDDATa:VALue "11001101"` sets the UDID data value as "11001100".

`SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:UDIDDATa:VALue?` might return `:SEARCH:SEARCH1:TRIGGER:A:BUS:SMBUS:UDIDDATa:VALue "11001101"`, indicating that the UDID data value is "11001101".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SOUrce

This command sets or queries the bus source for the bus search to determine where to place a mark. The search number is specified by x.

**Group**            Search and Mark

|                  |                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:SOURce B<x><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SOURce?                                                                                                                                                                            |
| <b>Arguments</b> | B<x> specifies the bus source as a bus number from B0 to B16.                                                                                                                                                                                                   |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:SOURCE B1 sets the bus source for bus trigger search 1 to B1.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:SOURCE? might return<br>SEARCH:SEARCH1:TRIGGER:A:BUS:SOURCE B15, indicating that the bus source for bus trigger search 1 is B15. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONDition

This command sets or queries the field or condition for which to search on a SpaceWire bus.

|                   |                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SPACEWIRE<br><br>This command affects most of the<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:B<x>:SPACEWIRE commands.                                                                                                                                                                                                                              |

indicating that the data field is the currently specified field within an SpaceWire frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONTROLCHARTYPE

This command sets or queries the control character type to use when searching on a SpaceWire bus signal.

**Conditions** Requires option SR-SPACEWIRE

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONTROLCHARTYPE  
{FCT|ESC|ENDOFPACKet}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONTROLCHARTYPE?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONDition](#)

**Arguments** SEARCH<x> is the search number.  
FCT sets the control character type to Flow Control Token.  
ESC sets the control character type to Escape.  
ENDOFPACKet sets the control character type to End of Packet.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:SPACEWIRE:CONTROLCHARTYPE FCT specifies Flow control token as the field on which to search within a SpaceWire frame.  
SEARCH:SEARCH1:TRIGger:A:BUS:SPACEWIRE:CONTROLCHARTYPE? might return SEARCH:SEARCH1:TRIGger:A:BUS:SPACEWIRECONTROLCHARTYPE ESC.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONTROLCODETYPE

This command sets or queries the control code type to use when searching on a SpaceWire bus signal.

**Conditions** Requires option SR-SPACEWIRE

|                         |                                                                                                                                                                                                                                                                                   |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE

This command sets or queries the length of the data string, in bytes, to use when searching on a SpaceWire bus signal. The search condition needs to be set to Data (see *Related Commands*).

|                         |                                                                                                                                                                                                  |

| <b>Group</b>            | Search and Mark                                                                                                                                                                                  |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE<NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE?                                                                                   |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SPACEWIRE:CONDition</a>                                                                                                                         |
| <b>Arguments</b>        | SEARCH<x> is the search number.<br><br>NR1 is an integer value that specifies the number of contiguous data bytes to use when searching on the SpaceWire data field. The valid range is 1 to 10. |

- Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE 4` specifies 4 as the number of contiguous data bytes to use when searching on the SpaceWire data field.
- `SEARCH:SEARCH5:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE?` might return `SEARCH:SEARCH5:TRIGger:A:BUS:SPACEWIRE:DATA:SIZE 10`, indicating that Search 5 is set to use 10 contiguous data bytes searching on the SpaceWire data field.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:VALue

This command sets or queries the binary data value to be used when searching on an SpaceWire bus signal. The search condition must be set to Data (see *Related Commands*).

- Conditions**     Requires option SR-SPACEWIRE
- Group**         Search and Mark
- Syntax**        `SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:VALue<QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:DATA:VALue?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:CONDition](#)

- Arguments**     `SEARCH<x>` is the search number.
- `<QString>` specifies the binary data value to search for on a SpaceWire bus signal.

- Examples**     `SEARCH:SEARCH1:TRIGger:A:BUS:SPACEWIRE:DATA:VALue "101011"` sets the data VALue to 101011.
- `SEARCH:SEARCH5:TRIGger:A:BUS:SPACEWIRE:DATA:VALue?` might return `SEARCH:SEARCH5:TRIGger:A:BUS:SPACEWIRE:DATA:VALue "10101"`, indicating that Search 5 is set to look for binary data value 10101.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRE:ERRORType

This command sets or queries the error type for which to search on the SpaceWire bus signal.

- Conditions**     Requires option SR-SPACEWIRE

|                         |                                                                                                                                                                                                                                                                                                                                                                                     |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRe:TIMECode:VALue

This command sets or queries the binary data string used for SpaceWire search if the search condition is Time Code.

|                         |                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SR-SPACEWIRE                                                                                                     |
| <b>Group</b>            | Search and Mark                                                                                                                  |
| <b>Syntax</b>           | SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRe:TIMECode:VALue<br><Qstring><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:SPACEWIRe:TIMECode:VALue? |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SPACEWIRe:CONDition</a>                                                         |

**Arguments** SEARCH<x> is the search number.  
 <QString> sets the binary data value to be used when searching on an SpaceWire bus signal.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:B:SPACEWIRE:TIMECode:VALue  
 "101011" sets the timecode value to binary 101011.  
 SEARCH:SEARCH1:TRIGger:A:BUS:B:SPACEWIRE:TIMECode:VALue?  
 might return  
 SEARCH:SEARCH1:TRIGger:A:BUS:B:SPACEWIRE:TIMECode:VALue  
 "101011".

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:CONDition

This command sets or queries the search condition for an SPI bus search to determine where to place a mark. The search number is specified by x.

**Conditions** Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:CONDition  
 {DATA|SS|STARTofframe}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:CONDition?

**Arguments** DATA specifies the trigger condition as Data.  
 SS specifies the trigger condition as Slave Selection.  
 STARTofframe specifies the trigger condition as start of frame.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:CONDITION SS sets the trigger condition for SPI bus trigger search 1 to SS.  
 SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:CONDITION? might return  
 SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:CONDITION DATA, indicating that the trigger condition for SPI bus trigger search 1 is set to Data.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:SIZE

This command sets or queries the length of the data string in bytes used for the specified SPI bus trigger search to determine where to place a mark. The search condition must be DATA. The search number is specified by x.

**Conditions** Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:SIZE <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:SIZE?

**Arguments** <NR1> specifies the number of contiguous data bytes.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:DATA:SIZE 1 sets the length of the data string for SPI bus trigger search 1 to 1 byte.

SEARCH:SEARCH2:TRIGGER:A:BUS:SPI:DATA:SIZE? might return  
:SEARCH:SEARCH2:TRIGGER:A:BUS:SPI:DATA:SIZE 4, indicating that the length of the data string for SPI bus trigger search 2 is 4 bytes.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:VALue

The command sets or queries the binary data string used for an SPI bus search to determine where to place a mark. The search number is specified by x. The search condition must be DATA.

**Conditions** Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:DATA:VALue?

**Arguments** <QString> specifies the data value in the specified valid format. The valid characters are 0, 1, and X for binary format; and A-F, 0-9, and X for hexadecimal format.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:DATA:VALUE "00001111"` sets the data value for SPI bus trigger search 1 to "00001111" in binary format.

`SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:DATA:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:DATA:VALUE "11"`, indicating that the data value for SPI bus trigger search 1 is set to "11" in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:SOURCEType

This command sets or queries trigger Source for SPI bus. The search number is specified by x.

**Conditions**     Requires option SR-SPI.

**Group**             Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:SOURCEType {MISo|MOSi}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:SPI:SOURCEType?`

**Arguments**        MISo specifies the trigger source as MISo. The default search source type is MISo.  
MOSi specifies the trigger source as MOSi.

**Examples**         `SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:SOURCEType MOSi` sets the trigger source for SPI bus trigger search 1 to MOSi.

`SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:SOURCEType?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:SPI:SOURCEType MOSi`, indicating that the trigger source for SPI bus trigger search 1 is MOSi.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:CONDition

This command sets or queries the search condition for an SPMI bus.

**Conditions**        Requires option SRPM

**Group**             Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:`  
`SPMI:CONDition {SSC|RESet|SLEep|`  
`SHUTdown|WAKEup|MASTERREAd|MASTERWRITe|REGREAd|REGWRITe|`

DEVICEDESCMASTERREAD|DEVICEDESCSLAVEREAD|EXTREGREAD|  
EXTREGWRITE|LONGEXTREGREAD|LONGEXTREGWRITE|REGOWRITE|  
AUTHENTICATE|TRANSFERBUSOWNERSHIP|PARITYERROR}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:SPMI:CONDITION?

**Arguments** SEARCH<x> is the search identifier number.

SSC specifies searching for the Sequence Start Condition.

RESET specifies searching for the Reset command sequence.

SLEEP specifies searching for the Sleep command sequence.

SHUTDOWN specifies searching for the Shutdown command sequence.

WAKEUP specifies searching for the Wakeup command sequence.

MASTERREAD specifies searching for the Master Read command sequence.

MASTERWRITE specifies searching for the Master Write command sequence.

REGREAD specifies searching for the Register Read command sequence.

REGWRITE specifies searching for the Register Write command sequence.

DEVICEDESCMASTERREAD specifies searching for the Device Descriptor Block Master Read command sequence

DEVICEDESCSLAVEREAD specifies searching for the Device Descriptor Block Slave Read command sequence.

EXTREGREAD specifies triggering on the Extended Register Read command sequence.

EXTREGWRITE specifies searching for the Extended Register Write command sequence.

LONGEXTREGREAD specifies searching for the Extended Register Read Long command sequence.

LONGEXTREGWRITE specifies searching for the Extended Register Write Long command sequence.

REGOWRITE specifies searching for the Register 0 Write command sequence.

AUTHENTICATE specifies searching for the Authentication command sequence.

TRANSFERBUSOWNERSHIP specifies searching for the Transfer Bus Ownership (TBO) command sequence.

PARITYERROR specifies searching for the parity errors.

**Examples** SEARCH:SEARCH4:TRIGGER:A:BUS:SPMI:CONDITION SLEEP specifies searching for a Sleep command sequence in search Search4.

SEARCH:SEARCH2:TRIGger:A:BUS:SPMI:CONDITION? might return  
:SEARCH:SEARCH2:TRIGger:A:BUS:SPMI:CONDITION MASTERREAD,  
indicating that search Search2 is searching for Master Read command sequences.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:DATA:SIZE

This command sets or queries the length of the data string, in bytes, to be used when searching on an SPMI bus signal.

**Conditions** Requires option SRPM.

The Search condition must be set to EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, or LONGEXTREGWRItE.

Note that this a floating point value. If the condition is set to REG0WRItE, the query return value will be a fractional value (0.875) because the data size is less than a byte.

**Group** Trigger

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:DATA:SIZE <NR2>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:DATA:SIZE?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:CONDition](#)  
[SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:DATA:VALue](#)

**Arguments** SEARCH<x> is the Search identifier number.  
<NR2> is the size of the data string in bytes.

**Examples** SEARCH:SEARCH2:TRIGger:A:BUS:SPMI:DATA:SIZE 1 sets the data size to 1 byte.

SEARCH:SEARCH2:TRIGger:A:BUS:SPMI:DATA:SIZE? might return  
SEARCH:SEARCH2:TRIGger:A:BUS:SPMI:DATA:SIZE 4 to indicate the search data pattern has four bytes of data.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:DATA:VALue

This command specifies the binary data string used for SPMI when the search condition is MASTERREAd, MASTERWRItE, REGREAd,

REGWRItE, EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, LONGEXTREGWRItE, or REG0WRItE.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:MASTERADDRESS:VALue

This command sets or queries the binary data string that identifies the master address used in SPMI when the search condition is MASTERREAd, MASTERWRItE, or DEVICEDeSCMASTERREAd.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:REGISTERADDReSS:VALue

This command sets or queries the binary data string that identifies the register address used in SPMI triggering if the trigger condition is MASTERREAd,

MASTERWRItE, REGREAd, REGWRItE, EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, or LONGEXTREGWRItE.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALue

This command sets or queries the binary data string that identifies the slave address used in SPMI when the search condition is RESet, SLEep, SHUTdown, WAKeup, AUTHenticate, REGREAd, REGWRItE, EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, LONGEXTREGWRItE, DEVICEDESCSLAVEREAd, or REG0WRItE.

|                   |                                                                     |
|-------------------|---------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRPM                                                |
| <b>Group</b>      | Search and Mark                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALue<br><QString> |

SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALUE?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:SPMI:CONDition](#)

**Arguments** SEARCH<x> is the search identifier number.  
 <QString> is the binary data string that identifies the slave address for which to search.

**Examples** SEARCH:SEARCH3:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALUE "0011" sets the binary slave address to 0011 on Search 3.  
 SEARCH:SEARCH1:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALUE? might return SEARCH:SEARCH1:TRIGger:A:BUS:SPMI:SLAVEADDRESS:VALUE "1010" to indicate the binary slave address is 1010 for Search 1.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMManD:RESPonse

This command sets or queries the command response of the respective command type for SVID bus.

**Conditions** Requires option SR-SVID

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMManD:RESPonse {GETReg| GETRegvender| GETRegtestcfg| SETFast| SETSlow| SETDecay| SETPs| SETRegaddr| SETRegdata| REGAddrvender| REGDatavender| REGAddrtestcfg| REGDatatestcfg| TESTmode| SETWp| GETRegpktrecent| GETRegpkta1ert| GETRegpktbody| GETRegvrent}  
 SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMManD:RESPonse?

**Arguments** SEARCH<x> is the search identifier number.  
 GETReg specifies the search condition as GETReg. This is the default command response condition.  
 GETRegvender specifies the search condition as GETRegvender.  
 GETRegtestcfg specifies the search condition as GETRegtestcfg.  
 SETFast specifies the search condition as SETFast.  
 SETSlow specifies the search condition as SETSlow.

SETDecay specifies the search condition as SETDecay.  
SETPs specifies the search condition as SETPs.  
SETRegaddr specifies the search condition as SETRegaddr.  
SETRegdata specifies the search condition as SETRegdata.  
REGAddrvender specifies the search condition as REGAddrvender.  
REGDatavender specifies the search condition as REGDatavender.  
REGAddrtestcfg specifies the search condition as REGAddrtestcfg.  
REGDatatestcfg specifies the search condition as REGDatatestcfg.  
TESTmode specifies the search condition as TESTmode.  
SETWp specifies the search condition as SETWp.  
GETRegpktrecent specifies the search condition as GETRegpktrecent.  
GETRegpktalert specifies the search condition as GETRegpktalert.  
GETRegpktbad specifies the search condition as GETRegpktbad.  
GETRegvrent specifies the search condition as GETRegvrent.

**Examples** SEARCH:SEARCH3:TRIGger:A:BUS:SVID:COMMANd:RESPonse SETSlow specifies setslow of set command as the field within a SVID frame to search on.  
SEARCH:SEARCH1:TRIGger:A:BUS:SVID:COMMANd:RESPonse? might return SEARCH:SEARCH1:TRIGger:A:BUS:SVID:COMMANd:RESPonse SETSlow, indicating that SETSlow is the currently specified field within a SVID frame to search on.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMMANd:TYPE

This command sets or queries the command type for SVID bus.

**Conditions** Requires option SR-SVID

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMMANd:TYPE  
{GET|SET|OPTional}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:COMMANd:TYPE?

|                  |                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p>SEARCH&lt;x&gt; is the search identifier number.</p> <p>GET specifies the search condition as GET. This is the default command type condition.</p> <p>SET specifies the search condition as SET.</p> <p>OPTIONal specifies the search condition as OPTIONal.</p>                                                                   |
| <b>Examples</b>  | <p>SEARCH:SEARCH3:TRIGger:A:BUS:SVID:COMManD:TYPe SET specifies SET as the field within a SVID frame to search on.</p> <p>SEARCH:SEARCH1:TRIGger:A:BUS:SVID:COMManD:TYPe? might return SEARCH:SEARCH1:TRIGger:A:BUS:SVID:COMManD:TYPe SET, indicating that SET is the currently specified field within a SVID frame to search on.</p> |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:SVID:CONDition

This command sets or queries the trigger condition for SVID bus.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-SVID                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>     | <pre>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SVID:CONDition {STARTCONDition  SLAVEADDRESS  COMManD  PAYLoad  ERRors} SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:SVID:CONDition?</pre>                                                                                                                                                                                                                                              |
| <b>Arguments</b>  | <p>SEARCH&lt;x&gt; is the search identifier number.</p> <p>STARTCONDition specifies the search condition as STARTCONDition. SEARCH:SEARCH1:TRIGGER:A:BUS:SVID:CONDITION? might return  
SEARCH:SEARCH1:TRIGGER:A:BUS:SVID:CONDITION ERRORS, indicating  
that ERRORS is the currently specified field within a SVID frame to search on.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:SVID:ERROR:TYPE

This command sets or queries the error type for SVID bus.

|                   |                                                                                                                                                                                                                                                                                                                                                                  |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:HIVALue

This command sets or queries the high binary address value used when searching on a USB bus signal to determine where to place a mark. The search number is specified by x. The search condition must be set to TOKEN.

The VALue and HIVALue set a range that the INrange and OUTrange qualifiers use to decide when to trigger. For example, if the QUALIFER is set to INrange, and the address is within the range set by VALue and HIVALue, then a trigger can be generated.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application. |
| <b>Group</b>      | Search and Mark                                                              |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:HIVALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:HIVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:VALue](#)

**Arguments** <QString> specifies the data value in the specified valid format. The valid characters are 0, 1, and X for binary; for hexadecimal; and symbolic).

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:HIVALUE  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:HIVALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:HIVALUE "XX", indicating that the address value for normal token for USB bus trigger search 1 is set to "XX," in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:VALue

This command sets or queries the binary address value used for a USB bus search to determine where to place a mark. The search number is specified by x. The search condition must be set to TOKEN.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:VALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:VALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ADDRESS:HIVALue](#)

**Arguments** <QString> specifies the data value in the specified valid format. Valid characters are 0, 1, and X for binary; A-F, 0-9 and X for hexadecimal; and for symbolic.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:VALUE "1110000" sets the address value for the normal token for USB bus trigger search 1 to "1110000" in binary format.  
  
SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ADDRESS:VALUE "11", indicating

that the address value for normal token for USB bus trigger search 1 is set to "11" hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CHARacter

This command sets or queries the trigger condition for an USB bus on specific control symbol. The search number is specified by x.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:COMPliance

This command sets or queries the trigger condition for an USB bus on Compliance Pattern sequences. The search number is specified by x.

**Conditions** Requires option SRUSB3. Packet view must be Off.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:COMPliance  
{CP1|CP3|CP4|CP56|CP78}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:COMPliance?

**Related Commands** [BUS:B<x>:USB:DISplaymode](#)

**Arguments** CP1 specifies the compliance pattern sequence as CP1.  
CP3 specifies the compliance pattern sequence as CP3.  
CP4 specifies the compliance pattern sequence as CP4.  
CP56 specifies the compliance pattern sequence as CP5 or CP6.  
CP78 specifies the compliance pattern sequence as CP7 or CP8.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:USB:COMPliance CP1 sets the compliance pattern sequence to CP1.  
  
SEARCH:SEARCH1:TRIGger:A:BUS:USB:COMPliance? might return :SEARCH:SEARCH1:TRIGger:A:BUS:USB:COMPliance CP3, indicating that the compliance pattern sequence for USB bus trigger search 1 is set to CP3.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CONDition

This command sets or queries the search condition for a USB bus search to determine where to place a mark. The search number is specified by x.

**Conditions** Requires option 5-SRUSB2, SUP5-SRUSB2, or SRUSB3 Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:USB:CONDITION {COMPATtern| CONTROLCH| CUSTom| DATAPacket| EOP| ERRor| HANDSHAKEPacket| OSET| PACKET| RESET| RESUME| SPECIALPacket| SUSPEND| SYNC| TOKENPacket}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:USB:CONDITION?

**Related Commands** [BUS:B<x>:USB:DISplaymode](#)

**Arguments** COMPATtern specifies the search condition as Compliance Pattern. Packet view must be Off. Requires option SRUSB3. Packet view must be Off.

CONTROLCH specifies the search condition as Control Character. Requires option SRUSB3.

CUSTom specifies the search condition as Custom symbol search. Packet view must be Off. Requires option SRUSB3. Packet view must be Off.

DATAPacket specifies the search condition as Data Packet.

EOP specifies the search condition as End of Packet.

ERRor specifies the search condition as Error.

HANDSHAKEPacket specifies the search condition as Handshake Packet.

OSET specifies the search condition as Ordered Set. Requires option SRUSB3.

PACKet specifies the search condition as Packets. Packet view must be On. Requires option SRUSB3. Packet view must be On.

RESET specifies the search condition as Reset.

RESUME specifies the search condition as Resume.

SPECIALPacket specifies the search condition as Special Packet.

SUSPEND specifies the search condition as Suspend.

SYNC specifies the search condition as Sync.

TOKENPacket specifies the search condition as Token (Address) Packet.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:CONDITION EOP sets the search condition for USB bus trigger search 1 to End of Packet.

SEARCH:SEARCH1:TRIGGER:A:BUS:USB:CONDITION? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:CONDITION SYNC, indicating that the search condition for USB bus trigger search 1 is set to Sync.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CRCTYPE

This command specifies the USB3 CRC trigger type to be valid on a CRC5, CRC16 or CRC32. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRUSB3.                                                                                                                                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                |

| <b>Arguments</b>  | CRC5 specifies CRC error type to be CRC5.<br>CRC16 specifies CRC error type to be CRC16.<br>CRC32 specifies CRC error type to be CRC32.                                                                                                                                        |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGger:A:BUS:USB:CRCTYPE CRC5 sets the CRC error type as CRC5.<br><br>SEARCH:SEARCH1:TRIGger:A:BUS:USB:CRCTYPE? might return :SEARCH:SEARCH1:TRIGger:A:BUS:USB:CRCTYPE CRC16, indicating that the CRC error type for USB bus trigger search 1 is set to CRC16. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTOm:CHARacters

This command sets or queries the pattern of characters in the custom pattern. The search number is specified by x.

|                   |                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRUSB3. The Mark On condition must be set to CUSTOm.                                                    |
| <b>Group</b>      | Search and Mark                                                                                                         |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTOm:CHARacters <Qstring><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTOm:CHARacters? |

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CONDition](#)

**Arguments** <QString> specifies the data value in the specified valid format (binary, hexadecimal, or symbolic). The valid characters for binary are 0, 1, and X. The value must be a series of K-codes or XXX.X. The default value is K28.5. A minimum of 1 character and a maximum of 16 characters.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:CHARacters  
"K28.5,XXX.X,K28.7" sets the pattern of characters for the custom pattern as K28.5,XXX.X,K28.7.

SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:CHARacters? might return SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:CHARacters "K28.5,XXX.X,K28.7", indicating the pattern of characters for the custom pattern is set to K28.5,XXX.X,K28.7.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:HEXVALue

This command sets or queries the pattern of Hex descrambled data values in the custom pattern. The search number is specified by x.

**Conditions** Requires option SRUSB3. The Mark On condition must be set to CUSTom.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:HEXVALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:HEXVALue?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CONDition](#)

**Arguments** <QString> specifies the data value in the specified valid format (binary, hexadecimal, or symbolic). The valid characters for binary are 0, 1, and X. The value must be a series of hex values. The default value is BC. A minimum of 1 bit values. A maximum of 16 bit values.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:HEXVALue  
"BC,FF,XX,11" sets the pattern of Hex descrambled data values for the custom pattern as BC,FF,XX,11.

SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:HEXVALue? might return SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:HEXVALue "BC,FF,XX,11", indicating the pattern of Hex descrambled data values for the custom pattern is set to BC,FF,XX,11.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS

This command sets or queries the number of symbols in the custom pattern. The search number is specified by x.

**Conditions** Requires option SRUSB3. The Mark On condition must be set to CUSTom.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:CONDition](#)

**Arguments** <NR1> specifies the number of symbols for the custom pattern. The default value is 1. A minimum of 1 character and a maximum of 16 characters.

**Examples** SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS 5 sets the number of symbols for the custom pattern as 5.

SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS? might return SEARCH:SEARCH1:TRIGger:A:BUS:USB:CUSTom:NUMSYMBOLS 5, indicating the number of symbols for the custom pattern is set to 5.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:HIVALue

This command sets or queries the high binary data value used with In Range and Out of Range qualifiers for a USB bus search to determine where to place a mark. The search number is specified by x. The search condition must be set to DATA.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:HIVALue <QString>  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:HIVALue?

**Arguments** <QString> specifies the data value in the specified valid format (binary, hexadecimal, or symbolic). The valid characters for binary are 0, 1, and X;

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:HIVALUE "XXXXX111"` sets the data value for USB bus trigger search 1 to "XXXXX111" in binary format.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:HIVALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:HIVALUE "11"`, indicating that the data value for USB bus trigger search 1 is set to "11" in hexadecimal format.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:OFFSet**

This command sets the byte offset to look for a data pattern at, in bytes, to be used when searching on a USB bus signal. The search number is specified by x. The search condition must be set to DATA.

- Conditions**     Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.
- Group**            Search and Mark
- Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:OFFSet <NR1>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:OFFSet?`
- Arguments**       <NR1> specifies the data offset in bytes.
- Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:OFFSet 5` sets the data offset for USB bus trigger search 1 to 5 bytes.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:OFFSet?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:OFFSet DONTCare`, indicating that the data offset for USB bus trigger search 1 is set to DONTCare.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:QUALifier**

This command sets or queries the qualifier to be used when searching on a USB bus signal. The search condition must be set to IDANDDATA OR DATA. The search number is specified by x.

- Conditions**       Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.
- Group**            Search and Mark

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:QUALifier {EQUAL UNEQUAL LESSthan MOREthan LESSEQUAL MOREEQUAL INrange OUTrange}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:QUALifier?                                                                                                                                                                                                                                                    |
| <b>Arguments</b> | EQUAL specifies the qualifier as Equal.<br>INrange specifies the qualifier as Inside Range.<br>LESSEQUAL specifies the qualifier as Less Than or Equal to.<br>MOREEQUAL specifies the qualifier as More Than or Equal to.<br>OUTrange specifies the qualifier as Out of Range.<br>UNEQUAL specifies the qualifier as Unequal.<br>LESSthan specifies the qualifier as Less Than.<br>MOREthan specifies the qualifier as More Than. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:BUS:USB:DATA:QUALifier INRANGE sets the qualifier to INRANGE.<br>SEARCH:SEARCH1:TRIGger:A:BUS:USB:DATA:QUALifier? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:QUALIFIER EQUAL indicating the qualifier is set to equal.                                                                                                                                                                           |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:SIZE

This command sets or queries the length of the data string, in bytes, used for a USB bus search to determine where to place a mark. The search number is specified by x. The search condition must be set to DATA.

|                   |                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.                        |
| <b>Group</b>      | Search and Mark                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:SIZE <NR1><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:SIZE? |
| <b>Arguments</b>  | <NR1> specifies the data size in bytes.                                                             |

- Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:SIZE 1` sets the size of the data string for USB bus trigger search 1 to 1 byte.
- `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:SIZE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:SIZE 3`, indicating that the size of the data string for USB bus trigger search 1 is set to 3 bytes.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:TYPE**

This command sets or queries the USB bus search type. The search number is specified by x.

- Conditions**     Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group**            Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:TYPE`  
`{ANY|DATA0|DATA1|DATA2|MDATA}`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:TYPE?`

- Arguments**        ANY specifies the data packet type as Any.
- DATA0 specifies the data packet type as DATA0.
- DATA1 specifies the data packet type as DATA1.
- DATA2 specifies the data packet type as DATA2.
- MDATA specifies the data packet type as MDATA.

- Examples**        `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:TYPE ANY` sets the data packet type for USB bus trigger search 1 to ANY.
- `SEARCH:SEARCH2:TRIGGER:A:BUS:USB:DATA:TYPE?` might return `:SEARCH:SEARCH2:TRIGGER:A:BUS:USB:DATA:TYPE MDADA`, indicating that the packet type for USB bus trigger search 2 is set to MDATA.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:VALue**

This command sets or queries the binary data value used for a USB bus search to determine where to place a mark. The search number is specified by x. The search condition must be set to DATA.

|                   |                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.                                                                                                                                                                                                                                                                                                               |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:DATA:VALue?                                                                                                                                                                                                                                                                                  |
| <b>Arguments</b>  | <QString> specifies the data value. The valid characters are 0, 1, and X for binary format; and A-F, 0-9, and X for hexadecimal format.                                                                                                                                                                                                                                                    |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:VALUE "AB" sets the data value for data token for USB bus trigger search 1 to "AB" in hexadecimal format.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:DATA:VALUE "XXXXXXXX", indicating that the data value for data token for USB bus trigger search 1 is set to "XXXXXXXX" in binary format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ENDPoint:VALue

This command sets or queries the endpoint binary value used for a USB bus search to determine where to place a mark. The search number is specified by x. The search condition must be set to TOKEN.

|                   |                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.                                                                                     |
| <b>Group</b>      | Search and Mark                                                                                                                                                  |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ENDPoint:VALue <QString><br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ENDPoint:VALue?                                                |
| <b>Arguments</b>  | <QString> specifies the data value in the specified valid format. The valid characters are 0, 1, and X for binary format; A-F, 0-9 and X for hexadecimal format. |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ENDPOINT:VALUE "1111" sets the endpoint value for normal token for USB bus trigger search 1 to "1111" in binary format.         |

SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ENDPOINT:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:ENDPOINT:VALUE "1", indicating that the endpoint value for normal token for USB bus trigger search 1 is set to "1" in hexadecimal format.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ERR8B10B:TYPE

This command specifies the USB3 8b10b encoding error trigger type to be valid on a character or disparity. The search number is specified by x.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:HANDSHAKEType

This command sets or queries the handshake type for the specified USB bus trigger search to determine where to place a mark. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.                                                                                                                                                                                                        |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:HANDSHAKEType {ACK ANY NAK NYET STALL}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:HANDSHAKEType?                                                                                                                                                      |
| <b>Arguments</b>  | <p>ACK specifies the handshake type as Acknowledgement (positive) (XX10).</p> <p>ANY specifies the handshake type as Any (0010).</p> <p>NAK specifies the handshake type as Negative Acknowledgment (1010).</p> <p>NYET specifies the handshake type as No response Yet (0110).</p> |

STALL specifies the handshake type as Stall (endpoint is halted or control pipe request not supported) (1110).

- Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:HANDSHAKETYPE NAK sets the handshake type for USB bus trigger search 1 to NAK.
- SEARCH:SEARCH2:TRIGGER:A:BUS:USB:HANDSHAKETYPE? might return :SEARCH:SEARCH2:TRIGGER:A:BUS:USB:HANDSHAKETYPE NYET, indicating that the handshake type for USB bus trigger search 2 is set to NYET.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:KEYPADTYPe

This command sets or queries whether the keypad is toggled to KCode or Data. The search number is specified by x.

- Conditions** Requires option SRUSB3. The keypad must be launched from Custom Pattern Editor for USB.
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:KEYPADTYPe {KCODE|DATA}  
SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:KEYPADTYPe?
- Arguments** KCODE sets the Symbol toggle to K-Code and Character keypad is loaded.  
DATA sets the Symbol toggle to Data and hex keypad is loaded.
- Examples** SEARCH:SEARCH1:TRIGger:A:BUS:USB:KEYPADTYPe KODE sets the Symbol toggle to K-Code and Character keypad is loaded.
- SEARCH:SEARCH1:TRIGger:A:BUS:USB:KEYPADTYPe? might return :SEARCH:SEARCH1:TRIGger:A:BUS:USB:KEYPADTYPe DATA, indicating that the Symbol toggle is Data and hex keypad is loaded.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:ORDerEd:SET

This command specifies the USB trigger type to be valid on ordered set condition. The search number is specified by x.

- Conditions** Requires option SRUSB3.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:PACKet:TYPEOFTP

This command sets or queries the trigger condition for an USB bus on specific packet for TP. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRUSB3.                                                                                                                                                                                                                                                                                              |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>     | <pre>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:USB:PACKet:TYPEOFTP {ACK  DEVNOTif  ERDY  NRDY  PING  PINGRSP  STATUS  STAL1  ANY} SEARCH:SEARCH&lt;x&gt;:TRIGger:A:BUS:USB:PACKet:TYPEOFTP?</pre>                                                                                                                         |
| <b>Arguments</b>  | <p>ACK specifies the transaction packet type as ACK.</p> <p>DEVNOTif specifies the transaction packet type as Dev Notification.</p> <p>ERDY specifies the transaction packet type as ERDY.</p> <p>NRDY specifies the transaction packet type as NRDY.</p> <p>PING specifies the transaction packet type as PING.</p> |

PINGRSP specifies the transaction packet type as ping response.

STATUS specifies the transaction packet type as status.

STALL specifies the transaction packet type as status.

ANY specifies any transaction packet type.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:PACKET:TYPEOFTP ACK sets the transaction packet type as ACK.

SEARCH:SEARCH1:TRIGGER:A:BUS:USB:PACKET:TYPEOFTP? might return :SEARCH:SEARCH1:TRIGGER:A:BUS:USB:PACKET:TYPEOFTP DEVNOTIF, indicating that the transaction packet for USB bus trigger search 1 is set to dev notification.

## SEARCH:SEARCH<x>:TRIGGER:A:BUS:USB:PACKETTYPE

This command sets or queries the trigger condition for an USB bus on specific packet. The search number is specified by x.

**Conditions** Requires option SRUSB3. Packet view must be On.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:BUS:USB:PACKETTYPE {LMP| TP| DP| ITP| ANY}  
SEARCH:SEARCH<x>:TRIGGER:A:BUS:USB:PACKETTYPE?

**Related Commands** [BUS:B<x>:USB:DISPLAYMODE](#)

**Arguments** LMP specifies the packet type as link management packet.

TP specifies the packet type as Transaction packet.

DP specifies the packet type as Data Packet.

ITP specifies the packet type as Isochronous timestamp packet.

ANY specifies the packet type as any type of packets.

**Examples** SEARCH:SEARCH1:TRIGGER:A:BUS:USB:PACKETTYPE LMP sets the packet type to LMP.

SEARCH:SEARCH1:TRIGger:A:BUS:USB:PACKETType? might return :SEARCH:SEARCH1:TRIGger:A:BUS:USB:PACKETType TP, indicating that the packet type for USB bus trigger search 1 is set to TP.

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SOFFRAMENUMber

This command sets or queries the frame number string to use for the Start of Frame for the specified USB bus trigger search to determine where to place a mark. The search number is specified by x. The search condition must be set to TOKEN.

| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:ET:VALue<br>{BULK CONTROL NOCARE INTERRUPT ISOchronous}<br>SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:ET:VALue?                                                                                                                                                                                       |
| <b>Arguments</b>  | <p>BULK specifies the Endpoint Type value as Bulk (10).</p> <p>CONTROL specifies the Endpoint Type value as Control (00).</p> <p>NOCARE specifies the Endpoint Type value as Don't Care.</p> <p>INTERRUPT specifies the Endpoint Type value as Interrupt (11).</p> <p>ISOchronous specifies the Endpoint Type value as Isochronous (01).</p> |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:ET:VALUE BULK` sets the Endpoint Type value for USB bus trigger search 1 to Bulk.

`SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:ET:VALUE?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:ET:VALUE DONTCARE`, indicating that the Endpoint Type value for USB bus trigger search 1 is set to DONTCare.

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:HUB:VALue**

This command sets or queries the binary hub address value to be used when searching on a USB bus signal. The search number is specified by x. The search condition must be set to Special with packet type SPLIT.

**Conditions**     Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group**            Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:HUB:VALue <QString>`  
`SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:HUB:VALue?`

**Arguments**        <QString> specifies the hub address. The valid characters are .

**Examples**         `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:HUB:VALue "1001"` sets the hub address to "XXX1001".

`SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:HUB:VALue?` might return `SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:HUB:VALue "XX"` (for binary format), indicating that the hub address for the USB bus trigger search on split token field is "XX".

## **SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:PORT:VALue**

This command sets or queries the binary port address used when searching on a USB bus signal. The search number is specified by x. The search condition must be set to Special with a packet type SPLIT.

**Conditions**        Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:PORT:VALUE "1111" sets the port address for USB bus trigger search 1 to "XXX1111" for binary format.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:PORT:VALUE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:SPLIT:PORT:VALUE "XX", indicating that the port address for USB hub trigger search 1 is set to "XX" in hexadecimal format. |

## SEARCH:SEARCH<x>:TRIGger:A:BUS:USB:SPLIT:SC:VALue

This command sets or queries the Start/Complete value for the specified USB bus trigger on split token field search to determine where to place a mark. The search number is specified by x.

|                   |                                                                                                                                                                                                                                                                |

| <b>Arguments</b>  | ANY specifies the token type as Any (XX01).<br>IN specifies the token type as IN (1001).<br>OUT specifies the token type as OUT (0001).<br>SETUP specifies the token type as SETUP (1101).<br>SOF specifies the token type as Start Of Frame (0101).                                                        |
| <b>Examples</b>   | SEARCH:SEARCH1:TRIGGER:A:BUS:USB:TOKENTYPE IN sets the token type for USB bus trigger search 1 to IN.<br><br>SEARCH:SEARCH1:TRIGGER:A:BUS:USB:TOKENTYPE? might return SEARCH:SEARCH1:TRIGGER:A:BUS:USB:TOKENTYPE SOF, indicating that the token type for USB bus trigger search 1 is set to Start Of Frame. |

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod

This command sets or queries the DDRRead search burst detection method.

|                   |                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br><br>Requires a 6 Series MSO instrument.<br><br>Set the DDR Read standard (DDR3 or LPDDR3) before using this command. See Related Commands. |
| <b>Group</b>      | Search and Mark                                                                                                                                                         |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod  
{DQDQS|ChipSelect|LogicState}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:STANDARD](#)

**Arguments** DQDQS sets the burst detection method to DQDQS.  
ChipSelect sets the burst detection method to ChipSelect.  
LogicState sets the burst detection method to LogicState.

**Examples** SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTDETECTmethod DQDQS sets the burst detection method as DQ/DQS Phase alignment.  
SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTDETECTmethod? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTDETECTmethod DQDQS indicating that the DDR read burst detection method is DQDQS.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLatency

This command sets or queries the DDR read logic state burst latency value.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command. See Related Commands.  
Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLatency <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLatency?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
<NR3> sets the logic state burst latency value.

- Examples**     `SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTLatency 500E-3` sets the DDRREAD burst latency value of search 1 to .005.
- `SEARCH:SEARCH3:TRIGger:A:DDRREAD:BURSTLatency?` might return `SEARCH:SEARCH3:TRIGger:A:DDRREAD:BURSTLatency 500E-3`, indicating that the DDRREAD logic burst latency value is set to 500E-3 for search 3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLENGTH

This command sets or queries the DDR read logic state burst length value.

- Conditions**     Requires option 6-DBDDR3.
- Requires a 6 Series MSO instrument.
- Set the DDR Read standard (DDR3 or LPDDR3) before using this command. See Related Commands.
- Set burst detection method as "Logic State".

**Group**            Search and Mark

**Syntax**           `SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLENGTH <NR1>`  
`SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTLENGTH?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments**        `SEARCH<x>` specifies the search number.

`NR1` sets the logic state burst length value.

- Examples**        `SEARCH:SEARCH3:TRIGger:A:DDRREAD:BURSTLENGTH 10` sets the DDRREAD logic state burst length value of search 3 to 10 bursts.
- `SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTLENGTH?` might return `SEARCH:SEARCH1:TRIGger:A:DDRREAD:BURSTLENGTH 8`, indicating that the DDRREAD logic state burst length value is set to 8 bursts for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSActive

This command sets or queries the DDR Read chip select active state.

**Conditions**        Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Chip Select"

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSActive {LOW|HIGH}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSActive?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
LOW sets the DDR read chip select active state to low.  
HIGH sets the DDR read chip select active state to high.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREAD:CSActive LOW sets the DDRREAD chip select active to LOW for search 2.  
SEARCH:SEARCH4:TRIGger:A:DDRREAD:CSActive? might return  
SEARCH:SEARCH4:TRIGger:A:DDRREAD:CSActive HIGH, indicating the DDRREAD chip select active value for search 4 is set to HIGH.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSLevel

This command sets or queries the DDR Read chip select level value.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Chip Select"

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSLevel <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSLevel?

|                         |                                                                                                                                                                                                                                                                                                          |

| <b>Arguments</b>        | <p>SEARCH&lt;x&gt; specifies the search number.</p> <p>Auto sets the DDR read chip select mode to auto.</p> <p>Manual sets the DDR read chip select mode to manual. Use the Related Commands to set the Reference levels when in Manual mode.</p> |
| <b>Examples</b>         | <p>SEARCH:SEARCH2:TRIGger:A:DDRREAD:CSMode MANUAL sets the DDRREAD search chip select mode to Manual for search 2.</p>                                                                                                                            |

SEARCH:SEARCH3:TRIGger:A:DDRREAD:CSMode? might return  
SEARCH:SEARCH3:TRIGger:A:DDRREAD:CSMode Manual, indicating that the  
DDRREAD search 3 chip select mode is set to manual.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSSource

This command sets or queries the DDR Read search chip select source.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Chip Select".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSSource  
{CH<x>|CH<x>\_D<x>|MATH<x>|REF<x>|REF<x>\_D<x>}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:CSSource?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.

CH<x> specifies channel <x> as the DDR read chip select source for the specified search <x>.

CH<x>\_D<x> specifies digital waveform <x> of channel <x> as the DDR read strobe source for the specified search <x>.

MATH<x> specifies math waveform <x> as the DDR read chip select source for the specified search <x>.

REF<x> specifies reference waveform <x> as the DDR read chip select source for the specified search <x>.

REF<x>\_D<x> specifies digital waveform <x> of reference waveform <x> as the DDR read strobe source for the specified search <x>.

**Examples** SEARCH:SEARCH5:TRIGger:A:DDRREAD:CSSource CH2 sets the search 5 chip select source waveform to CH2 for DDR Read search.

SEARCH:SEARCH3:TRIGger:A:DDRREAD:CSSource? might return  
SEARCH:SEARCH3:TRIGger:A:DDRREAD:CSSource CH2, indicating that  
Channel 2 waveform is the source for the DDRRead chip select source of search 3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:DATARate

This command sets or queries the DDR read search data rate for DDR3 and LPDDR3 standards of the specified search.

The DDR3 standard supports the following data rates:  
800|1066|1333|1600|1866|2133.

The LPDDR3 standard supports the following data rates:  
333|800|1066|1200|1333|1466|1600|1866|2133.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:DATARate  
{333|800|1066|1200|1333|1466|1600|1866|2133}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:DATARate?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:STANdard](#)

**Arguments** 333 sets the data rate to 333.  
800 sets the data rate to 800.  
1066 sets the data rate to 1066.  
1200 sets the data rate to 1200.  
1333 sets the data rate to 1333.  
1466 sets the data rate to 1466.  
1600 sets the data rate to 1600.  
1866 sets the data rate to 1866.  
2133 sets the data rate to 2133.

**Examples**     `SEARCH:SEARCH2:TRIGGER:A:DDRREAD:DATARate 1333` sets the data rate to 1333 for DDR read Search 2.

`SEARCH:SEARCH1:TRIGGER:A:DDRREAD:DATARate?` might return  
`SEARCH:SEARCH1:TRIGGER:A:DDRREAD:DATARate 800` indicating that the data rate for DDR read Search 1 is 800.

## SEARCH:SEARCH<x>:TRIGGER:A:DDRREAD:DATASource

This command sets or queries the DDR read data source when the search type is DDR READ.

**Conditions**     Requires option 6-DBDDR3

                      Requires 6 Series MSO instrument

                      Load a reference waveform on the instrument before using this command to set the search data source to a reference waveform.

**Group**            Search and Mark

**Syntax**            `SEARCH:SEARCH<x>:TRIGGER:A:DDRREAD:DATASource`  
                          `{CH<x>|CH<x>_D<x>|MATH<x>|REF<x>|REF<x>_D<x>}`  
                          `SEARCH:SEARCH<x>:TRIGGER:A:DDRREAD:DATASource?`

**Arguments**        `CH<x>` specifies channel <x> as the DDR read data source for the specified search <x>.

`CH<x>_D<x>` specifies digital waveform <x> of channel <x> as the DDR read data source for the specified search <x>.

`MATH<x>` specifies math waveform <x> as the DDR read data source for the specified search <x>.

`REF<x>` specifies reference waveform <x> as the DDR read data source for the specified search <x>.

`REF<x>_D<x>` specifies digital waveform <x> of reference waveform <x> as the DDR read data source for the specified search <x>.

**Examples**         `SEARCH:SEARCH1:TRIGGER:A:DDRREAD:DATASource CH2` sets the source waveform for the A trigger to Channel 2.

`SEARCH:SEARCH1:TRIGGER:A:DDRREAD:DATASource?` might return  
`SEARCH:SEARCH1:TRIGGER:A:DDRREAD:DATASource REF1`, indicating that the Reference waveform 1 DDR read trigger data is the source for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:HYSteresis

This command sets or queries the DDR read hysteresis reference level value, when the search type is DDR READ.

|                         |                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | <p>Requires option 6-DBDDR3.</p> <p>Requires a 6 Series MSO instrument.</p> <p>Set the DDR read reference level mode to Manual before using this command. | <b>Group</b>            | Search and Mark                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>           | <pre>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:DDRREAD:HYSteresis &lt;NR3&gt; SEARCH:SEARCH&lt;x&gt;:TRIGger:A:DDRREAD:HYSteresis?</pre>                                                                                                                                                              |
| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:DDRREAD:REFLEVELMode</a>                                                                                                                                                                                                                        |
| <b>Arguments</b>        | <NR3> sets the DDR read search hysteresis percent value in the range of 0% to 50%.                                                                                                                                                                                                           |
| <b>Examples</b>         | <p>SEARCH:SEARCH2:TRIGger:A:DDRREAD:HYSteresis 15 sets the DDR read search hysteresis value to 15%.</p> <p>SEARCH:SEARCH1:TRIGger:A:DDRREAD:HYSteresis? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:HYSteresis 10, indicating that the DDR read search hysteresis value is set to 10%.</p> |

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:LOGIC1SOUrce:SYMBol

This command sets or queries the DDR read logic source 1 symbol.

|                   |                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | <p>Requires option 6-DBDDR3.</p> <p>Requires a 6 Series MSO instrument.</p> <p>Set the DDR Read standard (DDR3 or LPDDR3) before using this command. See Related Commands.</p> <p>Set burst detection method as "Logic State".</p> |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                    |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:LOGIC1SOURCE:SYMBOL  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:LOGIC1SOURCE:SYMBOL?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
H sets the logic source 1 symbol to H (High).  
L sets the logic source 1 symbol to L (Low).  
X sets the logic source 1 symbol to X (Don't care).

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRREAD:LOGIC1SOURCE:SYMBOL X sets the DDRREAD logic source 1 symbol of search 3 to X (don't care).  
SEARCH:SEARCH1:TRIGger:A:DDRREAD:LOGIC1SOURCE:SYMBOL? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:LOGIC1SOURCE:SYMBOL L, indicating that the DDRREAD logic source 1 symbol is set to Low for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:LOGIC2SOURCE:SYMBOL

This command sets or queries the DDR read logic source 2 symbol.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Logic State".

**Group** Search and Mark

| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument.                                                          |
| <b>Group</b>      | Search and Mark                                                                                                           |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:PREAMBLE:TYPE<br>{STATIC DYNAMIC}<br>SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:PREAMBLE:TYPE? |

**Arguments**     `STATIC` sets the DDR Read preamble type to Static.  
`DYNAMIC` sets the DDR Read preamble type to Dynamic.

**Examples**     `SEARCH:SEARCH2:TRIGger:A:DDRREAD:PREAMBLE:TYPE STATIC` sets the DDR read preamble type to Static for Search 2.  
`SEARCH:SEARCH4:TRIGger:A:DDRREAD:PREAMBLE:TYPE?` might return `SEARCH:SEARCH4:TRIGger:A:DDRREAD:PREAMBLE:TYPE DYNAMIC`, indicating that the DDR read preamble type for Search 4 is set to dynamic mode.

## **SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH**

This command sets or queries the DDR read data high reference level value, when the search type is DDR READ.

**Conditions**     Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR read reference level mode to Manual before using this command.  
See Related Commands.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH <NR3>`  
`SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode](#)

**Arguments**     `<NR3>` sets the DDR read search data high reference value.

**Examples**     `SEARCH:SEARCH2:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH 3.8E-3` sets the DDR read search data high reference value.  
`SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH?` might return `SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH 50E-3`, indicating that the DDR read search data high reference value is set to 50E-3.

**SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:LOW**

This command sets or queries the DDR read data low reference level value, when the search type is DDR READ.

|                         |                                                                                                                                                                                                                                                                                                                              |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:DATA:MID <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:DATA:MID?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search data mid reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREAD:REFLeve1:DATA:MID 3.8E-3 sets the DDR read search data mid reference value.

SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:DATA:MID? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:DATA:MID 50E-3, indicating that the DDR read search data mid reference value is set to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:STROBE:HIGH

This command sets or queries the DDR read reference level strobe high value, when the search type is DDR READ.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR read reference level mode to Manual before using this command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:STROBE:HIGH <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:STROBE:HIGH?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search strobe high value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREAD:REFLeve1:STROBE:HIGH 3.8E-3 sets the DDR read search strobe high value.

SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:STROBE:HIGH? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:STROBE:HIGH 50E-3, indicating that the DDR read search strobe high value is set to 50E-3.

**SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:STROBE:LOW**

This command sets or queries the DDR read reference level strobe low value, when the search type is DDR READ.

| <b>Group</b>      | Search and Mark                                                                                                                                                      |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:STROBE:MID <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLeve1:STROBE:MID?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search strobe mid reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREAD:REFLeve1:STROBE:MID 3.8E-3  
sets the DDR read search strobe mid reference value.

SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:STROBE:MID? might  
return SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLeve1:STROBE:MID  
50E-3, indicating that the DDR read search strobe mid reference value is set  
to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode

This command sets or queries the DDR read reference level mode to auto or manual, when the search type is DDR READ.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode  
{AUTO|MANUAL}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLEVELMode?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:HIGH](#)  
[SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:LOW](#)  
[SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:REFLevel:DATA:MID](#)

**Arguments** AUTO sets the DDR read reference level mode to auto.  
MANUAL sets the DDR read reference level mode to manual. Use the Related  
Commands to set the Reference levels when in Manual mode.

- Examples** SEARCH:SEARCH3:TRIGger:A:DDRREAD:REFLEVELMode MANUAL sets the DDR read search reference level mode to Manual for Search 3.
- SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLEVELMode? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:REFLEVELMode MANUAL, indicating that the DDR read search reference level mode set to automatic for Search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:STANdard

This command sets or queries the DDR read search standard as DDR3 or LPDDR3.

- Conditions** Requires option 6-DBDDR3  
Requires 6 Series MSO instrument
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:STANdard {DDR3|LPDDR3}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:STANdard?
- Arguments** DDR3 sets the DDR read search standard as DDR3.  
LPDDR3 sets the DDR read search standard as LPDDR3.
- Examples** SEARCH:SEARCH2:TRIGger:A:DDRREAD:STANdard DDR3 sets the DDR standard to DDR3 for DDR read Search 2.
- SEARCH:SEARCH5:TRIGger:A:DDRREAD:STANdard? might return SEARCH:SEARCH5:TRIGger:A:DDRREAD:STANdard LPDDR3, indicating that the DDR standard is set to LPDDR3 for DDR read Search 5.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:STROBESource

This command sets or queries the DDR read strobe source when the search type is DDR READ.

- Conditions** Requires option 6-DBDDR3  
Requires 6 Series MSO instrument
- Load a reference waveform on the instrument before using this command to set the search data source to a reference waveform.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREAD:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
<NR3> sets the logic state tolerance value.

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRREAD:TOLERance 400E-3 sets the DDRREAD logic state tolerance value of search 3 to .004.  
SEARCH:SEARCH1:TRIGger:A:DDRREAD:TOLERance? might return SEARCH:SEARCH1:TRIGger:A:DDRREAD:TOLERance 500E-3, indicating that the DDRREAD logic state tolerance value is set to 500E-3 for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod

This command sets or queries the DDR Read/Write search burst detection method.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod {DQDQS|ChipSelect|LogicState}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:STANdard](#)

**Arguments** DQDQS sets the read/write burst detection method to DQDQS.  
ChipSelect sets the read/write burst detection method to ChipSelect.  
LogicState sets the read/write burst detection method to LogicState.

**Examples** SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod DQDQS sets the burst detection method as Logic state + burst latency  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod? might return  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod

LogicState, indicating that the DDR ReadWrite burst detection method is Logic state + burst latency.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTLatency

This command sets or queries the DDR read/write logic state burst latency value.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTLENGTH

This command sets or queries the DDR read/write logic state burst length value.

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument. |
|-------------------|------------------------------------------------------------------|

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTLENGTH <NR1>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTLENGTH?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
NR1 sets the logic state burst length value.

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:BURSTLENGTH 10 sets the DDRREADWRITE logic state burst length value of search 3 to 10 bursts.  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:BURSTLENGTH? might return SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:BURSTLENGTH 8, indicating that the DDRREADWRITE logic state burst length value is set to 8 bursts for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSActive

This command sets or queries the DDR Read/Write chip select active state.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Chip Select"

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSActive {LOW|HIGH}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSActive?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

- Arguments** SEARCH<x> specifies the search number.  
LOW sets the DDR read/write chip select active state to low.  
HIGH sets the DDR read/write chip select active state to high.
- Examples** SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:CSActive LOW sets the DDRREADWRITE chip select active to LOW.  
SEARCH:SEARCH4:TRIGger:A:DDRREADWRITE:CSActive? might return SEARCH:SEARCH4:TRIGger:A:DDRREADWRITE:CSActive HIGH, indicating the DDRREADWRITE search chip select active value for search 4 is set to HIGH.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSLevel

This command sets or queries the DDR Read/Write chip select level value.

- Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Chip Select"
- Group** Search and Mark
- Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSLevel <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSLevel?
- Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)  
[SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSMode](#)
- Arguments** SEARCH<x> specifies the search number.  
<NR3> sets the DDR read/write chip select level value.
- Examples** SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:CSLevel 2.8E-3 sets the DDR read/write chip select level value to 2.8E-3.  
SEARCH:SEARCH4:TRIGger:A:DDRREADWRITE:CSLevel? might return SEARCH:SEARCH4:TRIGger:A:DDRREADWRITE:CSLevel 2.8E-3, indicating the DDR read/write search chip select level value for search 4 is set to 2.8E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:CSMode

This command sets or queries the DDR read/write chip select mode.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:DATARate

This command sets or queries the DDR read/write data rate for DDR3 and LPDDR3 standards of the specified search.

The DDR3 standard supports the following data rates:  
800|1066|1333|1600|1866|2133.

The LPDDR3 standard supports the following data rates:  
333|800|1066|1200|1333|1466|1600|1866|2133.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read/Write standard (DDR3 or LPDDR3) before using this command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:DATARate  
{333|800|1066|1200|1333|1466|1600|1866|2133}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:DATARate?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:STANdard](#)

**Arguments**

- 333 sets the data rate to 333.
- 800 sets the data rate to 800.
- 1066 sets the data rate to 1066.
- 1200 sets the data rate to 1200.
- 1333 sets the data rate to 1333.
- 1466 sets the data rate to 1466.
- 1600 sets the data rate to 1600.
- 1866 sets the data rate to 1866.
- 2133 sets the data rate to 2133.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:DATARate 1333 sets the data rate to 1333 for DDR read Search 2.

SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:DATARate? might return  
SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:DATARate 1466 indicating that the data rate for DDR read Search 5 is 1466.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:DATASource

This command sets or queries the DDR read/write data source when the search type is DDR READWRITE.

**Conditions**

- Requires option 6-DBDDR3
- Requires 6 Series MSO instrument

Load a reference waveform on the instrument before using this command to set the search data source to a reference waveform.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:HYSteresis

This command sets or queries the DDR read/write hysteresis reference level value, when the search type is DDR READWRITE.

|                   |                                                                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | <p>Requires option 6-DBDDR3.</p> <p>Requires a 6 Series MSO instrument.</p> <p>Set the DDR read/write reference level mode to Manual before using this command. See Related Commands.</p> |
| <b>Group</b>      | Search and Mark                                                                                                                                                                           |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:HYSteresis <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:HYSteresis?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read/write search hysteresis percent value in the range of 0% to 50%.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:HYSteresis 10 sets the DDR read/write search hysteresis value to 10%.

SEARCH:SEARCH1:TRIGger:A:DDRREAWRITE:HYSteresis? might return SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:HYSteresis 5, indicating that the DDR read/write search hysteresis value is set to 5%.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC1SOUrce:SYMBol

This command sets or queries the DDR read/write logic source 1 symbol.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC1SOUrce:SYMBol  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC1SOUrce:SYMBol?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
H sets the logic source 1 symbol to H (High).  
L sets the logic source 1 symbol to L (Low).  
X sets the logic source 1 symbol to X (Don't care).

**Examples**     `SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:LOGIC1SOURCE:SYMBOL X`  
sets the DDRREADWRITE logic source 1 symbol of search 3 to X (don't care)

`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC1SOURCE:SYMBOL?`  
might return  
`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC1SOURCE:SYMBOL L`,  
indicating that the DDRREADWRITE logic source 1 symbol is set to Low  
for search 1.

## **SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL**

This command sets or queries the DDR read/write logic source 2 symbol.

**Conditions**     Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Logic State".

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL`  
`{H|L|X}`  
`SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments**     `SEARCH<x>` specifies the search number.  
H sets the logic source 2 symbol to H (High).  
L sets the logic source 2 symbol to L (Low).  
X sets the logic source 2 symbol to X (Don't care).

**Examples**     `SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL X`  
sets the DDRREADWRITE logic source 2 symbol of search 3 to X (don't care)

`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL?`  
might return  
`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC2SOURCE:SYMBOL L`,  
indicating that the DDRREADWRITE logic source 2 symbol is set to Low  
for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC3SOURCE:SYMBOL

This command sets or queries the DDR read/write logic source 3 symbol.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL

This command sets or queries the DDR read/write logic source 4 symbol.

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| <b>Conditions</b> | <p>Requires option 6-DBDDR3.</p> <p>Requires a 6 Series MSO instrument.</p> |
|-------------------|-----------------------------------------------------------------------------|

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
H sets the logic source 4 symbol to H (High).  
L sets the logic source 4 symbol to L (Low).  
X sets the logic source 4 symbol to X (Don't care).

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL X  
sets the DDRREADWRITE logic source 4 symbol of search 3 to X (don't care)  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL?  
might return  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:LOGIC4SOURCE:SYMBOL L,  
indicating that the DDRREADWRITE logic source 4 symbol is set to Low  
for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MARGIN

This command sets or queries the DDR read/write margin reference level value,  
when the search type is DDR READWRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.

Set the DDR read/write reference level mode to Manual before using this  
command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MARgin <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MARgin?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read/write search margin percent value in the range of 0% to 100%.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:MARgin 15 sets the DDR read/write search margin value to 15%.

SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:MARgin? might return SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:MARgin 10, indicating that the DDR read/write search margin value is set to 10%.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MAXCAS

This command sets or queries the DDR read/write chip maximum Column Access Strobe (CAS) value.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Chip Select"

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MAXCAS <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MAXCAS?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
<NR3> sets the DDR read chip select CAS maximum value.

**Examples** SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:MAXCAS 3.8E-3 sets the DDR read chip select CAS maximum value to 3.8 milliseconds for search 1.

SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:MAXCAS? might return SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:MAXCAS 2.1E-3, indicating that the DDR read chip select CAS maximum value is set to 2.1 milliseconds for search 5.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:MINCas

This command sets or queries the DDR read/write chip minimum Column Access Strobe (CAS) value.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE

This command sets or queries the DDR read/write preamble type when the search type is DDR READWRITE.

|                   |                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument.                                                                    |
| <b>Group</b>      | Search and Mark                                                                                                                     |
| <b>Syntax</b>     | SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE<br>{STATIC DYNAMIC}<br>SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE? |
| <b>Arguments</b>  | STATIC sets the DDR Read/Write preamble type to Static.<br>DYNAMIC sets the DDR Read/Write preamble type to Dynamic.                |

**Examples**     `SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE STATIC`  
sets the search 2 DDR read preamble type to Static.

`SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE?` might  
return `SEARCH:SEARCH5:TRIGger:A:DDRREADWRITE:PREAMBLE:TYPE`  
`DYNAMIC`, indicating that the DDR read/write preamble type for Search 5 is set  
to dynamic mode.

## **SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH**

This command sets or queries the DDR read/write data high reference level value,  
when the search type is DDR READWRITE.

**Conditions**     Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR read/write reference level mode to Manual before using this  
command. See Related Commands.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH`  
`<NR3>`  
`SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH?`

**Related Commands**     [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLEVELMode](#)

**Arguments**     `<NR3>` sets the DDR read/write search data high reference value.

**Examples**     `SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH`  
`3.8E-3` sets the DDR read/write search data high reference value.

`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH?`  
might return  
`SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:REFLevel:DATA:HIGH`  
`50E-3`, indicating that the DDR read/write search data high reference value is  
set to 50E-3.

## **SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:DATA:LOW**

This command sets or queries the DDR read/write data low reference level value,  
when the search type is DDR READWRITE.

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLEVELMode](#)

**Arguments**    <NR3> sets the DDR read/write search data mid reference value.

**Examples**    SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:REFLeve1:DATA:MID  
3.8E-3 sets the DDR read/write search data mid reference value.

SEARCH:SEARCH1:TRIGger:A:DDRREAWRITE:REFLeve1:DATA:MID? might  
return SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:REFLeve1:DATA:MID  
50E-3, indicating that the DDR read/write search data mid reference value is  
set to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:STROBE:HIGH

This command sets or queries the DDR read/write reference level strobe high value, when the search type is DDR READWRITE.

**Conditions**    Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR read/write reference level mode to Manual before using this command. See Related Commands.

**Group**    Search and Mark

**Syntax**    SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLeve1:STROBE:HIGH  
<NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLeve1:STROBE:  
HIGH?

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLEVELMode](#)

**Arguments**    <NR3> sets the DDR read search strobe high value.

**Examples**    SEARCH:SEARCH2:TRIGger:A:DDRREADWRITE:REFLeve1:STROBE:HIGH  
3.8E-3 sets the DDR read/write search strobe high value.

SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:REFLeve1:STROBE:HIGH?  
might return  
SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:REFLeve1:STROBE:HIGH  
50E-3, indicating that the DDR read/write search strobe high value is set to 50E-3.

**SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:REFLevel:STROBE:LOW**

This command sets or queries the DDR read/write reference level strobe low value, when the search type is DDR READWRITE.

## SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:TOLERance

This command sets or queries the DDR read/write logic state tolerance value.

|                   |                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | <p>Requires option 6-DBDDR3.</p> <p>Requires a 6 Series MSO instrument.</p> <p>Set the DDR Read standard (DDR3 or LPDDR3) before using this command.<br/>See Related Commands.</p> |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:TOLERance <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:TOLERance?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRREADWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
<NR3> sets the logic state tolerance value.

**Examples** SEARCH:SEARCH1:TRIGger:A:DDRREADWRITE:TOLERance 400E-3 sets the DDRREADWRITE logic state tolerance value of search 1 to .004.  
  
SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:TOLERance? might return SEARCH:SEARCH3:TRIGger:A:DDRREADWRITE:TOLERance 500E-3, indicating that the DDRREADWRITE logic state tolerance value is set to 500E-3 for search 3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod

This command sets or queries the DDRWRITE search burst detection method.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

| <b>Related Commands</b> | <a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:DDRWRITE:BURSTDETECTmethod</a><br><a href="#">SEARCH:SEARCH&lt;x&gt;:TRIGger:A:DDRWRITE:CSMode</a>                                                                   |

**Arguments** SEARCH<x> specifies the search number.  
 <NR3> sets the DDR write chip select level value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:CSLevel 2.8E-3 sets the DDR write chip select level value to 2.8E-3  
 SEARCH:SEARCH5:TRIGger:A:DDRWRITE:CSLevel? might return SEARCH:SEARCH5:TRIGger:A:DDRWRITE:CSLevel 2.8E-3, indicating the DDR write search chip select level value for search 5 is set to 2.8E-3

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSMode

This command sets or queries the DDR Write chip select mode.

**Conditions** Requires option 6-DBDDR3.  
 Requires a 6 Series MSO instrument.  
 Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
 See Related Commands.  
 Set burst detection method as "Chip Select"

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSMode {Auto|Manual}  
 SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSMode?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
 Auto sets the DDR write chip select mode to auto.  
 Manual sets the DDR write chip select mode to manual. Use the Related Commands to set the Reference levels when in Manual mode.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:CSMode MANUAL sets the DDR write search chip select mode to Manual for search 2.  
 SEARCH:SEARCH3:TRIGger:A:DDRWRITE:CSMode? might return SEARCH:SEARCH3:TRIGger:A:DDRWRITE:CSMode Manual, indicating that the DDR write search 3 chip select mode is set to manual.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSSource

This command sets or queries the DDR Write search chip select source.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSSource  
{CH<x>|CH<x>\_D<x>|MATH<x>|REF<x>|REF<x>\_D<x>}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:CSSource?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.

CH<x> specifies channel <x> as the DDR write chip select source for the specified search <x>.

CH<x>\_D<x> specifies digital waveform <x> of channel <x> as the DDR write strobe source for the specified search <x>.

MATH<x> specifies math waveform <x> as the DDR write chip select source for the specified search <x>.

REF<x> specifies reference waveform <x> as the DDR write chip select source for the specified search <x>.

REF<x>\_D<x> specifies digital waveform <x> of reference waveform <x> as the DDR write strobe source for the specified search <x>.

**Examples** SEARCH:SEARCH5:TRIGger:A:DDRWRITE:CSSource CH2 sets the search 5 chip select source waveform to CH2 for DDR write search.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:CSSource? might return  
SEARCH:SEARCH1:TRIGger:A:DDRWRITE:CSSource CH2, indicating that the Channel 2 waveform is the source for the DDR write chip select source of search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:DATARate

This command sets or queries the DDR write search data rate for DDR3 and LPDDR3 standards of the specified search.

The DDR3 standard supports the following data rates:  
800|1066|1333|1600|1866|2133.

The LPDDR3 standard supports the following data rates:  
333|800|1066|1200|1333|1466|1600|1866|2133.

|                         |                                                                                                                                                                                                                                                                                                                              |

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:HYSteresis

This command sets or queries the DDR write hysteresis reference level value, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR write reference level mode to Manual before using this command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:HYSteresis <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:HYSteresis?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR write search hysteresis percent value in the range of 0% to 50%.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:HYSteresis 7 sets the DDR write search hysteresis value to 7%.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:HYSteresis? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:HYSteresis 10, indicating that the DDR write search hysteresis value is set to 10%.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC1SOUrcе:SYMBol

This command sets or queries the DDR write logic source 1 symbol.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command. See Related Commands.  
Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC1SOURCE:SYMBOL  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC1SOURCE:SYMBOL?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
H sets the logic source 1 symbol to H (High).  
L sets the logic source 1 symbol to L (Low).  
X sets the logic source 1 symbol to X (Don't care).

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRWRITE:LOGIC1SOURCE:SYMBOL X sets the DDRWRITE logic source 1 symbol of search 3 to X (don't care)  
SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC1SOURCE:SYMBOL? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC1SOURCE:SYMBOL L, indicating that the DDRWRITE logic source 1 symbol is set to Low for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC2SOURCE:SYMBOL

This command sets or queries the DDR write logic source 2 symbol.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.  
Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC2SOURCE:SYMBOL  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC2SOURCE:SYMBOL?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC3SOURCE:SYMBOL? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC3SOURCE:SYMBOL L, indicating that the DDRWRITE logic source 3 symbol is set to Low for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL

This command sets or queries the DDR write logic source 4 symbol.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
See Related Commands.

Set burst detection method as "Logic State".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL  
{H|L|X}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments** SEARCH<x> specifies the search number.  
H sets the logic source 4 symbol to H (High).  
L sets the logic source 4 symbol to L (Low).  
X sets the logic source 4 symbol to X (Don't care).

**Examples** SEARCH:SEARCH3:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL X sets the DDRWRITE logic source 4 symbol of search 3 to X (don't care)  
SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:LOGIC4SOURCE:SYMBOL L, indicating that the DDRWRITE logic source 4 symbol is set to Low for search 1.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MARGIN

This command sets or queries the DDR write margin reference level value, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
 Requires a 6 Series MSO instrument.  
 Set the DDR write reference level mode to Manual before using this command.  
 See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MARgin <NR3>  
 SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MARgin?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR write search margin percent value in the range of 0% to 100%.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:MARgin 11 sets the DDR write search margin value to 11%.  
 SEARCH:SEARCH1:TRIGger:A:DDRWRITE:MARgin? might return  
 SEARCH:SEARCH1:TRIGger:A:DDRWRITE:MARgin 5, indicating that the DDR write search margin value is set to 5%.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MAXCAS

This command sets or queries the DDR write chip select maximum Column Access Strobe (CAS) value.

**Conditions** Requires option 6-DBDDR3.  
 Requires a 6 Series MSO instrument.  
 Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
 See Related Commands.  
 Set burst detection method as "Chip Select".

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MAXCAS <NR3>  
 SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MAXCAS?

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments**    SEARCH<x> specifies the search number.  
                  <NR3> sets the DDR write chip select CAS maximum value.

**Examples**    EARCH:SEARCH1:TRIGger:A:DDRWRITE:MAXCAS 3.8E-3 sets the DDR write chip select CAS maximum value to 3.8 milliseconds for search 1.  
  
                  SEARCH:SEARCH2:TRIGger:A:DDRWRITE:MAXCAS? might return  
                  SEARCH:SEARCH2:TRIGger:A:DDRWRITE:MAXCAS 3.8E-3, indicating that  
                  the DDR write chip select CAS maximum value is set to 3.8 milliseconds for  
                  search 2.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MINCas

This command sets or queries the DDR write chip select minimum Column Access Strobe (CAS) value.

**Conditions**    Requires option 6-DBDDR3.  
                  Requires a 6 Series MSO instrument.  
                  Set the DDR Read standard (DDR3 or LPDDR3) before using this command.  
                  See Related Commands.  
                  Set burst detection method as "Chip Select".

**Group**    Search and Mark

**Syntax**    SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MINCas <NR3>  
                  SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:MINCas?

**Related Commands**    [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:BURSTDETECTmethod](#)

**Arguments**    SEARCH<x> specifies the search number.  
                  <NR3> sets the DDR write chip select CAS minimum value.

**Examples**    EARCH:SEARCH1:TRIGger:A:DDRWRITE:MINCas 3.8E-3 sets the DDR write chip select CAS minimum value to 3.8 milliseconds for search 1.  
  
                  SEARCH:SEARCH2:TRIGger:A:DDRWRITE:MINCas? might return  
                  SEARCH:SEARCH2:TRIGger:A:DDRWRITE:MINCas 3.8E-3, indicating that

the DDR write chip select CAS minimum value is set to 3.8 milliseconds for search 2.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:POSTAMBLE:LENGth

This command sets or queries the DDR write postamble length when the search type is DDR WRITE.

|                   |                                                                                                                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument.                                                                                                                                                                                                                                                                   |
| <b>Group</b>      | Search and Mark                                                                                                                                                                                                                                                                                                                    |

| <b>Arguments</b>  | 500E-1.5 sets the postamble length to 1.5 tCK (number of clock cycles).<br>500E-1 sets the postamble length to 1 tCK (number of clock cycles).<br>500E-3 sets the postamble length to 0.5 tCK (number of clock cycles).                                                                                                            |
| <b>Examples</b>   | SEARCH:SEARCH6:TRIGger:A:DDRWRITE:POSTAMBLE:LENGth 500E-3 sets the DDR write postamble length for Search 6 to 0.5 tCK.<br><br>SEARCH:SEARCH2:TRIGger:A:DDRWRITE:POSTAMBLE:LENGth? might return SEARCH:SEARCH2:TRIGger:A:DDRWRITE:POSTAMBLE:LENGth 500E-1, indicating that the write postamble length for Search 2 is set to 1 tCK. |

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:PREAMBLE:TYPE

This command sets or queries the DDR write preamble type when the search type is DDR WRITE.

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument. |
| <b>Group</b>      | Search and Mark                                                  |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:PREAMBLE:TYPE  
{STATIC|DYNAMIC}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:PREAMBLE:TYPE?

**Arguments** STATIC sets the DDR Write preamble type to Static.  
DYNAMIC sets the DDR Write preamble type to Dynamic.

**Examples** SEARCH:SEARCH1:TRIGger:A:DDRWRITE:PREAMBLE:TYPE STATIC sets the DDR write preamble type to Static for Search 1.  
SEARCH:SEARCH4:TRIGger:A:DDRWRITE:PREAMBLE:TYPE? might return SEARCH:SEARCH4:TRIGger:A:DDRWRITE:PREAMBLE:TYPE DYNAMIC, indicating that the DDR write preamble type for Search 4 is set to dynamic mode.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH

This command sets or queries the DDR write data high reference level value, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR write reference level mode to Manual before using this command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search data high reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH 3.8E-3 sets the DDR write search data high reference value.  
SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:DATA:HIGH 50E-3, indicating that the DDR write search data high reference value is set to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:DATA:LOW

This command sets or queries the DDR write data low reference level value, when the search type is DDR WRITE.

|                         |                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument.<br>Set the DDR write reference level mode to Manual before using this command. See Related Commands.                                                                                                                                                                         |
| <b>Group</b>            | Search and Mark                                                                                                                                                                                                                                                                                                                               |

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:DATA:MID

This command sets or queries the DDR write data mid reference level value, when the search type is DDR WRITE.

|                   |                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 6-DBDDR3.<br>Requires a 6 Series MSO instrument.<br>Set the DDR write reference level mode to Manual before using this command. See Related Commands. |
| <b>Group</b>      | Search and Mark                                                                                                                                                       |

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:DATA:MID <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:DATA:MID?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search data mid reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:REFLeve1:DATA:MID 3.8E-3  
sets the DDR write search data mid reference value.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLeve1:DATA:MID? might  
return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLeve1:DATA:MID  
50E-3, indicating that the DDR write search data mid reference value is set to  
50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:STROBE:HIGH

This command sets or queries the DDR write reference level strobe high value,  
when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.

Requires a 6 Series MSO instrument.

Set the DDR write reference level mode to Manual before using this command.  
See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:STROBE:HIGH  
<NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:STROBE:HIGH?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR write search strobe high value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:REFLeve1:STROBE:HIGH  
3.8E-3 sets the DDR write search strobe high value.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:STROBE:HIGH? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:STROBE:HIGH 50E-3, indicating that the DDR write search strobe high value is set to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW

This command sets or queries the DDR write reference level strobe low value, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.  
Set the DDR write reference level mode to Manual before using this command. See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search strobe low reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW 3.8E-3 sets the DDR write search strobe low reference value.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW? might return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLevel:STROBE:LOW 50E-3, indicating that the DDR write search strobe low reference value is set to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLevel:STROBE:MID

This command sets or queries the DDR write reference level strobe mid value, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.

Set the DDR write reference level mode to Manual before using this command.  
See Related Commands.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:STROBE:MID  
<NR3>  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLeve1:STROBE:MID?

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode](#)

**Arguments** <NR3> sets the DDR read search strobe mid reference value.

**Examples** SEARCH:SEARCH2:TRIGger:A:DDRWRITE:REFLeve1:STROBE:MID 3.8E-3  
sets the DDR write search strobe mid reference value.

SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLeve1:STROBE:MID? might  
return SEARCH:SEARCH1:TRIGger:A:DDRWRITE:REFLeve1:STROBE:MID  
50E-3, indicating that the DDR write search strobe mid reference value is set  
to 50E-3.

## SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode

This command sets or queries the DDR write reference level mode to auto or manual, when the search type is DDR WRITE.

**Conditions** Requires option 6-DBDDR3.  
Requires a 6 Series MSO instrument.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode  
{AUTO|MANUAL}  
SEARCH:SEARCH<x>:TRIGger:A:DDRWRITE:REFLEVELMode?

| <b>Arguments</b> | <p>CH&lt;x&gt; specifies one input channel as the edge source, where the channel number is specified by x.</p> <p>CH&lt;x&gt;_D&lt;x&gt; specifies a digital reference waveform as the source waveform for the specified search.</p> <p>MATH&lt;x&gt; specifies the math waveform as the search source, where the math number is specified by x.</p> <p>REF&lt;x&gt; specifies the reference waveform as the search source, where the reference number is specified by x.</p> <p>REF&lt;x&gt;_D&lt;x&gt; specifies a digital reference waveform as the source waveform for the specified search.</p> |
| <b>Examples</b>  | <p>SEARCH:SEARCH1:TRIGGER:A:EDGE:SOURCE CH2 sets the source waveform for the A trigger to Channel 2.</p> <p>SEARCH:SEARCH1:TRIGGER:A:EDGE:SOURCE? might return<br/>SEARCH:SEARCH1:TRIGGER:A:EDGE:SOURCE CH2, indicating that the Channel 2 edge trigger is the source for search 1.</p>                                                                                                                                                                                                                                                                                                              |

## SEARCH:SEARCH<x>:TRIGger:A:EDGE:THReshold

This command sets or queries the source threshold level for an edge trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                               |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:EDGE:THReshold <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:EDGE:THReshold? |
| <b>Arguments</b> | <NR3> is the source threshold level for an edge trigger search.                               |

**Examples**     `SEARCH:SEARCH1:TRIGger:A:EDGE:THReshoId 50.0e-3` sets the threshold to 50 mV.

`SEARCH:SEARCH1:TRIGger:A:EDGE:THReshoId?` might return  
`SEARCH:SEARCH1:TRIGGER:A:EDGE:THRESHOLD 0.0E+0` indicating the threshold is 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:LOGIc:CLOCK:THReshold

This command sets or queries the logic clock threshold for a logic trigger search to determine where to place a mark. The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:LOGIc:CLOCK:THReshoId <NR3>`  
`SEARCH:SEARCH<x>:TRIGger:A:LOGIc:CLOCK:THReshoId?`

**Arguments**     <NR3> is the logic clock threshold.

**Examples**     `SEARCH:SEARCH1:TRIGger:A:LOGIc:CLOCK:THReshoId 50.0e-3` sets the threshold to 50 mV.

`SEARCH:SEARCH1:TRIGger:A:LOGIc:CLOCK:THReshoId?` might return  
`SEARCH:SEARCH1:TRIGGER:A:LOGIC:CLOCK:THRESHOLD 0.0E+0` indicating the threshold is set to 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:LOGIc:DELtAtime

This command specifies the Logic search delta time value. The time value is used as part of the Logic search condition to determine if the duration of a logic pattern meets the specified time constraints. The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:LOGIc:DELtAtime <NR3>`  
`SEARCH:SEARCH<x>:TRIGger:A:LOGIc:DELtAtime?`

**Arguments**     <NR3> is delta time value.

- Examples**    `SEARCH:SEARCH1:TRIGGER:A:LOGIC:DELTAtime 1.5e-9` sets the delta time to 1.5 ns.
- `SEARCH:SEARCH1:TRIGGER:A:LOGIC:DELTAtime?` might return `SEARCH:SEARCH1:TRIGGER:A:LOGIC:DELTAtime 1.0000E-9` indicating the delta time is 1.0 ns.

## **SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:FUNCTION**

This command sets or queries the logic operator for a pattern or state trigger search to determine where to place a mark. The search number is specified by x.

- Group**        Search and Mark
- Syntax**       `SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:FUNCTION {AND|NAND|NOR|OR}`  
`SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:FUNCTION?`
- Arguments**    `AND` places a mark if all conditions are true.
- `NAND` places a mark if any of the conditions are false.
- `NOR` places a mark if all conditions are false.
- `OR` places a mark if any of the conditions are true.
- Examples**     `SEARCH:SEARCH1:TRIGGER:A:LOGIC:FUNCTION AND` sets the trigger a logic function for search 1 to `AND`.
- `SEARCH:SEARCH1:TRIGGER:A:LOGIC:FUNCTION?` might return `SEARCH:SEARCH1:TRIGGER:A:LOGIC:FUNCTION NOR`, indicating that the logic function for search 1 is set to `NOR`.

## **SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:INPUT:CLOCK:SOURCE**

This command specifies or queries the channel to use as the clock source for logic trigger. The search number is specified by x.

- Group**        Search and Mark
- Syntax**       `SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:INPUT:CLOCK:SOURCE`  
`{CH<x>|CH<x>_D<x>|REF<x>_D<x>}`  
`SEARCH:SEARCH<x>:TRIGGER:A:LOGIC:INPUT:CLOCK:SOURCE?`

**Arguments** CH<x> specifies an analog channel as the search source, where the channel number is specified by x.

CH<x>\_D<x> specifies a digital reference waveform as the source waveform for the specified search.

REF<x>\_D<x> specifies a digital reference waveform as the source waveform for the specified search.

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:INPUT:CLOCK:SOURce CH2 sets the clock source to channel 2.

SEARCH:SEARCH1:TRIGger:A:LOGic:INPUT:CLOCK:SOURce? might return SEARCH:SEARCH1:TRIGGER:A:LOGIC:INPUT:CLOCK:SOURCE UNDEFINED indicating the clock source is not defined.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVel:CH<x>

This command sets or queries the voltage level to use for logic trigger search. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:CH<x> <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:CH<x>?

**Arguments** <NR3> is the voltage level to use for logic trigger search.

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:CH2 50.0e-3 sets the level to 50 mV.

SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:CH2? might return SEARCH:SEARCH1:TRIGGER:A:LOGIC:LEVEL:CH2 0.0E+0 indicating the level is set to 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVel:MATH<x>

This command sets the voltage level to use for logic trigger search. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:MATH<x> <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:MATH<x>?

**Arguments** <NR3> is the voltage level to use for logic trigger search.

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:MATH1 50.0e-3 sets the level to 50.0 mV.

SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:MATH1? might return  
SEARCH:SEARCH1:TRIGGER:A:LOGIC:LEVEL:MATH1 0.0E+0 indicating the level is set to 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:REF<x>

This command sets the voltage level to use for logic trigger search. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:REF<x> <NR3>  
SEARCH:SEARCH<x>:TRIGger:A:LOGic:LEVe1:REF<x>?

**Arguments** <NR3> is the voltage level to use for logic trigger search.

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:REF1 50.0e-3 sets the level to 50.0 mV.

SEARCH:SEARCH1:TRIGger:A:LOGic:LEVe1:REF1? might return  
SEARCH:SEARCH1:TRIGGER:A:LOGIC:LEVEL:REF1 0.0E+0 indicating the level is set to 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:LOGICPattern:CH<x>

This command sets or queries the conditions used for generating an A logic pattern, with respect to the defined input pattern, and identifies the time that the selected pattern may be true and still generate the trigger. The search number is specified by x.

**Group** Search and Mark

|                  |                                                                                                                                                                                                                                                      |

| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                   |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:LOGIc:LOGICPattern:MATH<x><br>{H L X}<br>SEARCH:SEARCH<x>:TRIGger:A:LOGIc:LOGICPattern:MATH<x>?                                                                                                                        |
| <b>Arguments</b> | H specifies triggering when the pattern is high.<br>L specifies triggering when the pattern is low.<br>X specifies triggering when the pattern is high or low.                                                                                    |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:LOGIc:LOGICPattern:MATH1 H sets the pattern to a high.<br>SEARCH:SEARCH1:TRIGger:A:LOGIc:LOGICPattern:MATH1? might return<br>SEARCH:SEARCH1:TRIGGER:A:LOGIC:LOGICPATTERN:MATH1 X indicating the pattern is a don't care. |

## SEARCH:SEARCH<x>:TRIGger:A:LOGIc:LOGICPattern:REF<x>

This command sets or queries the conditions used for generating an A logic pattern, with respect to the defined input pattern, and identifies the time that the selected pattern may be true and still generate the trigger. The search number is specified by x.

|                  |                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:LOGIc:LOGICPattern:REF<x> {H L X}<br>SEARCH:SEARCH<x>:TRIGger:A:LOGIc:LOGICPattern:REF<x>?                                          |
| <b>Arguments</b> | H specifies triggering when the pattern is high.<br>L specifies triggering when the pattern is low.<br>X specifies triggering when the pattern is high or low. |

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:LOGICPattern:REF1 H sets the pattern to a high.  
SEARCH:SEARCH1:TRIGger:A:LOGic:LOGICPattern:REF1? might return SEARCH:SEARCH1:TRIGGER:A:LOGIC:LOGICPATTERN:REF1 X indicating the pattern is a don't care.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:POLarity

This command sets or queries the polarity for the clock channel when Use Clock Edge is set to Yes for Logic search type. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:LOGic:POLarity {POSitive|NEGative|EITHer}  
SEARCH:SEARCH<x>:TRIGger:A:LOGic:POLarity?

**Arguments** POSitive specifies using the positive clock edge.  
NEGative specifies using negative clock edge.  
EITHer specifies using either the positive or negative clock edge.

**Examples** SEARCH:SEARCH1:TRIGger:A:LOGic:POLarity NEGATIVE sets the polarity to negative.  
SEARCH:SEARCH1:TRIGger:A:LOGic:POLarity? might return SEARCH:SEARCH1:TRIGGER:A:LOGIC:POLARITY POSITIVE indicating the polarity is set to positive.

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:USEClOCKedge

This command specifies whether or not Logic search uses a clock source. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:LOGic:USEClOCKedge {OFF|ON|0|1}  
SEARCH:SEARCH<x>:TRIGger:A:LOGic:USEClOCKedge?

|                  |                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p>OFF specifies not to use the clock source.</p> <p>ON specifies to use the clock source.</p> <p>0 specifies not to use the clock source.</p> <p>1 specifies to use the clock source.</p>                                                      |
| <b>Examples</b>  | <p>SEARCH:SEARCH1:TRIGger:A:LOGic:USEClockedge ON specifies to use the clock source.</p> <p>SEARCH:SEARCH1:TRIGger:A:LOGic:USEClockedge? might return SEARCH:SEARCH1:TRIGGER:A:LOGIC:USECLOCKEDGE 0 indicating not to use the clock source.</p> |

## SEARCH:SEARCH<x>:TRIGger:A:LOGic:WHEn

This command sets or queries the condition for generating an A or B logic search with respect to the defined input pattern.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                      |

## SEARCH:SEARCH<x>:TRIGger:A:PULSEWidth:THReshold

Sets or queries the source threshold level for a pulse width trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                           |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:PULSEwidth:THReshold <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:PULSEwidth:THReshold? |
| <b>Arguments</b> | <NR3> is the source threshold level for a pulse width trigger search.                                     |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:THRESHold 1.0e-9` sets to 1.0 V.  
`SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:THRESHold?` might return `SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:THRESHOLD 0.0E+0` indicating the threshold is 0.0 V.

## SEARCH:SEARCH<x>:TRIGGER:A:PULSEwidth:WHEN

This command specifies to search for a pulse with a width (duration) that is less than, greater than, equal to, or unequal to a specified value (set using `SEARCH:A:PULSEwidth:WIDTH`), OR whose `SEARCH:A:PULSEwidth:LOWLimit` and `SEARCH:A:PULSEwidth:HIGHLimit`). The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGGER:A:PULSEwidth:WHEN`  
`{LESSthan|MOREthan| EQUAL|UNEQUAL|WITHIn|OUTSide}`  
`SEARCH:SEARCH<x>:TRIGGER:A:PULSEwidth:WHEN?`

**Arguments**     `LESSthan` causes a search when a pulse is detected with a width less than the time set by the `SEARCH:A:PULSEwidth:WIDTH` command.  
`MOREthan` causes a search when a pulse is detected with a width greater than the time set by the `SEARCH:A:PULSEwidth:WIDTH` command.  
`EQUAL` causes a search when a pulse is detected with a width equal to the time period specified in `SEARCH:A:PULSEwidth:WIDTH` within a  $\pm 5\%$  tolerance.  
`UNEQUAL` causes a search when a pulse is detected with a width greater than or less than (but not equal) the time period specified in `SEARCH:A:PULSEwidth:WIDTH` within a  $\pm 5\%$  tolerance.  
`WITHIn` causes a search when a pulse is detected that is within a range set by two values.  
`OUTSide` causes a search when a pulse is detected that is outside of a range set by two values.

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:WHEN OUTSide` causes a search when a pulse is detected that is outside the set range.  
`SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:WHEN?` might return `SEARCH:SEARCH1:TRIGGER:A:PULSEwidth:WHEN WITHIn` indicating that a search will occur when a pulse is detected that is within a set range.

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:LOGICQUALification

This command specifies whether or not to use logic qualification for a runt search. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                     |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:RUNT:LOGICQUALification {ON OFF}<br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:LOGICQUALification?                                                                                                                                  |
| <b>Arguments</b> | ON specifies to use logic qualification for a runt search.<br>OFF specifies not to use logic qualification for a runt search.                                                                                                                       |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:RUNT:LOGICQUALification ON turns on logic qualification.<br><br>SEARCH:SEARCH1:TRIGger:A:RUNT:LOGICQUALification? might return SEARCH:SEARCH1:TRIGGER:A:RUNT:LOGICQUALIFICATION OFF indicating logic qualification is off. |

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:POLarity

This command specifies the polarity for the runt search. The search number is specified by x.

|                  |                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                        |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:RUNT:POLarity<br>{POSitive NEGative EITher}<br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:POLarity?                                                                                                    |
| <b>Arguments</b> | POSitive specifies using positive polarity for the runt search.<br>NEGative specifies using negative polarity for the runt search.<br>EITher specifies using either positive or negative polarity for the runt search. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:RUNT:POLarity NEGATIVE specifies using negative polarity for the runt search.                                                                                                                 |

SEARCH:SEARCH1:TRIGger:A:RUNT:POLArity? might return  
SEARCH:SEARCH1:TRIGGER:A:RUNT:POLARITY POSITIVE indicating the  
polarity is set to positive.

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:SOUrce

This command sets and queries the source for the Runt search input. The search number is specified by x.

|                  |                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                           |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:RUNT:SOUrce {CH<x> REF<x>}                                                                                                                                                                                     |
| <b>Arguments</b> | <p>CH&lt;x&gt; specifies an analog channel as the search source, where the channel number is specified by x.</p> <p>REF&lt;x&gt; specifies the reference waveform as the search source, where the reference number is specified by x.</p> |
| <b>Examples</b>  | <p>SEARCH:SEARCH1:TRIGger:A:RUNT:SOUrce CH1 sets the source to channel 1.</p> <p>SEARCH:SEARCH1:TRIGger:A:RUNT:SOUrce? might return<br/>SEARCH:SEARCH1:TRIGGER:A:RUNT:SOURCE CH2 indicating the source is set to channel 2.</p>           |

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:THReshold:HIGH

This command sets or queries the source threshold HIGH level for a runt trigger search to determine where to place a mark.

|                  |                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                         |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:RUNT:THReshold:HIGH <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:THReshold:HIGH? |
| <b>Arguments</b> | <NR3> is the source threshold HIGH level for a runt trigger search.                                     |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:RUNT:THReshold:HIGH 50.0E-3 sets the high threshold to 50 mV.                  |

SEARCH:SEARCH1:TRIGger:A:RUNT:THResho1d:HIGH? might return  
SEARCH:SEARCH1:TRIGGER:A:RUNT:THRESHOLD:HIGH 0.0E+0 indicating  
the high threshold is 0.0 V.

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:THReshold:LOW

Sets or queries the source threshold LOW level for a runt trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                   |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:RUNT:THResho1d:LOW <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:THResho1d:LOW?                                                                                                                                             |
| <b>Arguments</b> | <NR3> is the source threshold LOW level for a runt trigger search.                                                                                                                                                                                |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:RUNT:THResho1d:LOW 50.0e-3 sets the<br>thresholdo to 50 mV.<br><br>SEARCH:SEARCH1:TRIGger:A:RUNT:THResho1d:LOW? might return<br>SEARCH:SEARCH1:TRIGGER:A:RUNT:THRESHOLD:LOW 0.0E+0 indicating<br>the threshold is 0.0 V. |

## SEARCH:SEARCH<x>:TRIGger:A:RUNT:WHEn

This command sets or queries the condition setting for a runt trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Arguments</b> | LESSthan argument sets the instrument to search if the a<br>runt pulse is detected with width less than the time set by the<br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:WIDth command.<br><br>MOREthan argument sets the instrument to search if the a runt<br>pulse is detected with width more than the time set by the<br>SEARCH:SEARCH<x>:TRIGger:A:RUNT:WIDth command. |

**Equal** argument sets the instrument to search when the pattern is true for a time period equal to the time period specified in `SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH` within a  $\pm 5\%$  tolerance.

**NOTEEqual** argument sets the instrument to search when the pattern is true for a time period greater than or less than (but not equal) the time period specified in `SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH` within a  $\pm 5\%$  tolerance.

**OCCURS** argument specifies a search event if a runt of any detectable width occurs.

**Examples** `SEARCH:SEARCH1:TRIGGER:A:RUNT:WHEN MORETHAN` sets the instrument to trigger when a runt pulse is detected with width wider than the time set by the `SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH` command.

`SEARCH:SEARCH1:TRIGGER:A:RUNT:WHEN?` might return `SEARCH:SEARCH1:TRIGGER:A:RUNT:WHEN OCCURS`, indicating that a mark is placed if a runt trigger event occurs.

## SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH

This command sets or queries the width setting for a runt trigger search to determine where to place a mark. The search number is specified by *x*.

**Group** Search and Mark

**Syntax** `SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH <NR3>`  
`SEARCH:SEARCH<x>:TRIGGER:A:RUNT:WIDTH?`

**Arguments** `<NR3>` specifies the minimum width in seconds.

**Examples** `SEARCH:SEARCH1:TRIGGER:A:RUNT:WIDTH 400E-12` sets the runt trigger minimum width for search 1 to 0.4 nanoseconds.

`SEARCH:SEARCH1:TRIGGER:A:RUNT:WIDTH?` might return `SEARCH:SEARCH1:TRIGGER:A:RUNT:WIDTH 500.0000E-12`, indicating that the runt trigger minimum width for search 1 is set to 0.5 nanoseconds.

## SEARCH:SEARCH<x>:TRIGGER:A:SETHold:CLOCK:EDGE

This command sets or queries the clock slope setting for a setup/hold trigger search to determine where to place a mark. The search number is specified by *x*.

**Group** Search and Mark

| <b>Arguments</b> | <NR3> specifies the setup time for setup and hold violation triggering.                                                                                                                                                                                                                                                          |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:SETHOLD:SETTIME 2E-9 sets the setup/hold trigger setup time setting for search 1 to 2 ns.<br><br>SEARCH:SEARCH1:TRIGGER:A:SETHOLD:SETTIME? might return<br>SEARCH:SEARCH1:TRIGGER:A:SETHOLD:SETTIME 1.0000E-9, indicating that the setup/hold trigger setup time setting for search 1 is set to 1.0 ns. |

## SEARCH:SEARCH<x>:TRIGger:A:STATE

This command sets or queries the enabled state of the search. The search number is specified by x.

|                  |                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                 |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:STATE {<NR1> OFF ON}                                                                                                                                 |
| <b>Arguments</b> | <NR1> = 1 enables the search. Any other character disables the search.<br><br>ON enables the search.<br><br>OFF disables the search.                                            |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:STATE OFF disables the search.<br><br>SEARCH:SEARCH1:TRIGger:A:STATE? might return<br>SEARCH:SEARCH1:TRIGGER:A:STATE 1 indicating search 1 is enabled. |

## SEARCH:SEARCH<x>:TRIGger:A:STOPAcq

This command sets or queries whether acquisitions are stopped when a search hit is found. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:STOPAcq {<NR1> OFF ON}<br>SEARCH:SEARCH<x>:TRIGger:A:STOPAcq?                                                                                                                                                                                                                  |
| <b>Arguments</b> | <x> is the number of the search on which to enable or disable the stop acquisition function.<br><br><NR1> = 1 enables stopping when a search hit is found. Any other character disables the feature.<br><br>ON enables stopping when a search hit is found.<br><br>OFF disables stopping on a search hit. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:STOPAcq ON enables stopping when a search hit is found.<br><br>SEARCH:SEARCH3:TRIGger:A:STOPAcq? might return<br>:SEARCH:SEARCH3:TRIGGER:A:STOPACQ 1 indicating acquisitions are stopped when a search hit is found on search number 3.                                          |

## SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:LOGICQUALification

This command specifies whether or not to use logic qualification for a timeout search. The search number is specified by x.

|                  |                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                             |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:LOGICQUALification<br>{ON OFF}<br>SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:LOGICQUALification? |
| <b>Arguments</b> | ON specifies to use logic qualification.<br><br>OFF specifies not to use logic qualification.                               |

- Examples**     `SEARCH:SEARCH1:TRIGger:A:TIMEOut:LOGICQUALification ON` specifies to use logic qualification.
- `SEARCH:SEARCH1:TRIGger:A:TIMEOut:LOGICQUALification?` might return `SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:LOGICQUALIFICATION OFF` indicating logic qualification is off.

## SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:POLarity

The polarity to be used for a Timeout search. The search number is specified by x.

- Group**     Search and Mark
- Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:POLarity {STAYSHigh|STAYSLow|EITHer}`  
`SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:POLarity?`
- Arguments**     `STAYSHigh` specifies the polarity stays HIGH.  
`STAYSLow` specifies the polarity stays LOW.  
`EITHer` specifies the polarity stays HIGH or stays LOW.
- Examples**     `SEARCH:SEARCH1:TRIGger:A:TIMEOut:POLarity STAYSLow` specifies the polarity stays LOW.  
`SEARCH:SEARCH1:TRIGger:A:TIMEOut:POLarity?` might return `SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:POLARITY STAYSHIGH` indicating the polarity stays HIGH.

## SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:SOUrce

This command sets and queries the source for timeout search input. The search number is specified by x.

- Group**     Search and Mark
- Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:SOUrce {CH<x>|CH<x>_D<x>|MATH<x>|REF<x>|REF<x>_D<x>}`  
`SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:SOUrce?`

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p>CH&lt;x&gt; specifies an analog channel as the search source, where the channel number is specified by x.</p> <p>CH&lt;x&gt;_D&lt;x&gt; specifies a digital reference waveform as the source waveform for the specified search.</p> <p>MATH&lt;x&gt; specifies the math waveform as the search source, where the math number is specified by x.</p> <p>REF&lt;x&gt; specifies the reference waveform as the search source, where the reference number is specified by x.</p> <p>REF&lt;x&gt;_D&lt;x&gt; specifies a digital reference waveform as the source waveform for the specified search.</p> |
| <b>Examples</b>  | <pre>SEARCH:SEARCH1:TRIGger:A:TIMEOut:SOURce SEARCH:SEARCH1:TRIGger:A:TIMEOut:SOURce? might return SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:SOURCE CH1_D0 indicating CH1_D0 is the source.</pre>                                                                                                                                                                                                                                                                                                                                                                                                               |

## SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:THReshold

Sets or queries the source threshold level for a timeout trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                            |
| <b>Syntax</b>    | <pre>SEARCH:SEARCH&lt;x&gt;:TRIGger:A:TIMEOut:THResho1d &lt;NR3&gt; SEARCH:SEARCH&lt;x&gt;:TRIGger:A:TIMEOut:THResho1d?</pre>                                                                                                              |
| <b>Arguments</b> | <NR3> is the source threshold level for a timeout trigger search.                                                                                                                                                                          |
| <b>Examples</b>  | <pre>SEARCH:SEARCH1:TRIGger:A:TIMEOut:THResho1d 50.0e-3 sets the threshold to 50.0 mV. SEARCH:SEARCH1:TRIGger:A:TIMEOut:THResho1d? might return SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:THRESHOLD 0.0E+0 indicating the threshold is 0.0 V.</pre> |

## SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:TIME

This command sets or queries the time setting for a timeout trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:TIME <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:TIME?                                                                                                                                                                                                                 |
| <b>Arguments</b> | <NR3> is the time in seconds.                                                                                                                                                                                                                                                                             |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:TIME 400E-9 sets the timeout trigger time setting for search 1 to 400 ns.<br><br>SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:TIME? might return SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:TIME 500.0000E-12, indicating that the timeout trigger time setting for search 1 is set to 500 ns. |

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:DELTATime

This command sets or queries the transition time setting for a transition trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TRANSition:DELTATime <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:TRANSition:DELTATime?                                                                                                                                                                                                                       |
| <b>Arguments</b> | <NR3> specifies the transition time in seconds.                                                                                                                                                                                                                                                                                 |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:TIMEOUT:TIME 400E-9 sets the transition trigger time setting for search 1 to 400 ns.<br><br>SEARCH:SEARCH1:TRIGGER:A:TRANSITION:DELTATIME? might return SEARCH:SEARCH1:TRIGGER:A:TRANSITION:DELTATIME 500.0000E-12, indicating that the transition trigger time setting for search 1 is set to 500 ps. |

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:LOGICQUALification

This command specifies whether or not to use logic qualification for a transition search. The search number is specified by x.

|              |                 |
|--------------|-----------------|
| <b>Group</b> | Search and Mark |
|--------------|-----------------|

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:TRANSition:LOGICQUALification  
{ON|OFF}  
SEARCH:SEARCH<x>:TRIGger:A:TRANSition:LOGICQUALification?

**Arguments** ON specifies to use logic qualification for a transition search.  
OFF specifies not to use logic qualification for a transition search.

**Examples** SEARCH:SEARCH1:TRIGger:A:TRANSition:LOGICQUALification ON  
specifies to use logic qualification for a transition search.  
SEARCH:SEARCH1:TRIGger:A:TRANSition:LOGICQUALification? might  
return SEARCH:SEARCH1:TRIGGER:A:TRANSITION:LOGICQUALIFICATION  
OFF indicating logic qualification is off.

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:POLarity

This command specifies the polarity for the transition search. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:TRANSition:POLarity  
{POSitive|NEGative|EITher}  
SEARCH:SEARCH<x>:TRIGger:A:TRANSition:POLarity?

**Arguments** EITher places a mark on a transition of either polarity.  
NEGative places a mark on a transition of negative polarity.  
POSitive places a mark on a transition of positive polarity.

**Examples** SEARCH:SEARCH1:TRIGger:A:TRANSition:POLarity NEGATIVE places a  
mark on a transition of negative polarity.  
SEARCH:SEARCH1:TRIGger:A:TRANSition:POLarity? might return  
SEARCH:SEARCH1:TRIGGER:A:TRANSITION:POLARITY POSITIVE  
indicating the polaiity is positive.

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:SOUrce

This command sets and queries the source for the transition search input. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TRANSition:SOURce<br>{CH<x> MATH<x> REF<x>}<br>SEARCH:SEARCH<x>:TRIGger:A:TRANSition:SOURce?                                                                                                                                                                                                          |
| <b>Arguments</b> | CH<x> specifies an analog channel as the search source, where the channel number is specified by x.<br><br>MATH<x> specifies the math waveform as the search source, where the math number is specified by x.<br><br>REF<x> specifies the reference waveform as the search source, where the reference number is specified by x. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:TRANSition:SOURce CH1 sets the source to channel 1.<br><br>SEARCH:SEARCH1:TRIGger:A:TRANSition:SOURce? might return<br>SEARCH:SEARCH1:TRIGGER:A:TRANSITION:SOURCE CH2 indicating channel 2 is the source.                                                                                               |

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:HIGH

Sets or queries the source threshold HIGH level for a transition trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                             |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:HIGH <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:HIGH?                                                                                                                                                         |
| <b>Arguments</b> | <NR3> the source threshold HIGH level for a transition trigger search.                                                                                                                                                                                                      |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:TRANSition:THReshold:HIGH 50.0e-3 sets the high threshold to 50.0 mV.<br><br>SEARCH:SEARCH1:TRIGger:A:TRANSition:THReshold:HIGH? might return<br>SEARCH:SEARCH1:TRIGGER:A:TRANSITION:THRESHOLD:HIGH 0.0E+0 indicating the high threshold is 0.0 V. |

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:LOW

Sets or queries the source threshold LOW level for a transition trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:LOW <NR3><br>SEARCH:SEARCH<x>:TRIGger:A:TRANSition:THReshold:LOW?                                                                                                                                                              |
| <b>Arguments</b> | <NR3> is the source threshold LOW level for a transition trigger searchk.                                                                                                                                                                                                      |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:TRANSition:THReshold:LOW -50.0e-3<br>sets the LOW threshold to -50.0 mV.<br><br>SEARCH:SEARCH1:TRIGger:A:TRANSition:THReshold:LOW? might return<br>SEARCH:SEARCH1:TRIGGER:A:TRANSITION:THRESHOLD:LOW 0.0E+0<br>indicating the LOW threshold is 0.0 V. |

## SEARCH:SEARCH<x>:TRIGger:A:TRANSition:WHEn

This command sets or queries the condition setting for a transition trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:TRANSition:WHEn<br>{FASTERthan SLOWERthan EQua1 UNEQua1}<br>SEARCH:SEARCH<x>:TRIGger:A:TRANSition:WHEn?                                                                                                                                                                                                                                                                                                                             |
| <b>Arguments</b> | FASTERthan sets the trigger to occur when the transitioning signal is faster than the set volts/second rate.<br><br>SLOWERthan sets the trigger to occur when the transitioning signal is slower than the set volts/second rate.<br><br>EQua1 sets the trigger to occur when the transitioning signal is equal to the set volts/second rate.<br><br>UNEQua1 sets the trigger to occur when the transitioning signal is not equal to the set volts/second rate. |

**Examples**     `SEARCH:SEARCH1:TRIGGER:A:TRANSITION:WHEN SLOWERTHAN` sets the transition trigger condition setting for search 1 to SLOWERTHAN.

`SEARCH:SEARCH1:TRIGGER:A:TRANSITION:WHEN?` might return `SEARCH:SEARCH1:TRIGGER:A:TRANSITION:WHEN FASTERTHAN`, indicating that the transition trigger condition setting for search 1 is set to FASTERTHAN.

## SEARCH:SEARCH<x>:TRIGger:A:TYPE

This command sets or queries the trigger type setting for a search to determine where to place a mark. The search number is specified by x.

**Group**     Search and Mark

**Syntax**     `SEARCH:SEARCH<x>:TRIGger:A:TYPE`  
                   {EDGE|RUNT|TRANSITION|PULSEwidth|TIMEOut|LOGic|  
                   SETHold|WINDow|Bus|DDRRead|DDRREADwrite|DDRwrite}  
                   `SEARCH:SEARCH<x>:TRIGger:A:TYPE?`

**Arguments**     EDGE triggers when the source input signal amplitude crosses the specified level in the direction given by the slope.

---

**NOTE.** *Some trigger types are optional.*

---

RUNT triggers when a pulse crosses the first preset voltage threshold but does not cross the second preset threshold before recrossing the first. The thresholds are set with the `SEARCH:SEARCH<x>:TRIGger:A:RUNt:HIGH` and `SEARCH:SEARCH<x>:TRIGger:A:RUNt:LOW THRESHOLD` commands.

TRANSITION triggers when a pulse crosses both thresholds in the same direction as the specified polarity and the transition time between the two threshold crossings is greater or less than the specified time delta.

PULSEwidth triggers on input signal source pulses that are inside or outside of the given time range specified by `SEARCH:SEARCH<x>:TRIGger:A:LOGic:PATtern:WHEn:LESSLimit` and `SEARCH:SEARCH<x>:TRIGger:A:LOGic:PATtern:WHEn:MORELimit`. The polarity is selected using the `SEARCH:SEARCH<x>:TRIGger:A:RUNt:POLarity` command.

TIMEOut triggers on an input signal source that stays above, stays below, or stays either above or below the trigger level for a given time.

LOGIC specifies that a search occurs when specified conditions are met, and is controlled by the `SEARCH:A:LOGic` commands.

SETHold triggers on a functional pattern combination of one to three data sources at the time of the clock transition.

WINDOW triggers on an input signal source that enters or exits the horizontal band defined by the two trigger levels.

BUS specifies that a search occurs when a communications signal is found.

DDRRead triggers on a DDR Read event.

DDRREADWrite triggers on a DDR Read or Write event.

DDRWrite triggers on a DDR Write event.

**Examples** SEARCH:SEARCH1:TRIGGER:A:TYPE RUNT sets the trigger type setting for search 1 to RUNT.

SEARCH:SEARCH1:TRIGGER:A:TYPE? might return  
SEARCH:SEARCH1:TRIGGER:A:TYPE EDGE, indicating that the trigger type setting for search 1 is set to EDGE.

## SEARCH:SEARCH<x>:TRIGger:A:WINDow:CROSSIng

This command sets or queries the window trigger threshold crossing of the selected trigger Source. The threshold crossing selection is only effective when :TRIGger:A:WINDow:WHEN is INSIDEGreater or OUTSIDEGreater. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGger:A:WINDow:CROSSIng  
{UPPER|LOWER|EITHER|NONE}  
SEARCH:SEARCH<x>:TRIGger:A:WINDow:CROSSIng?

**Arguments** UPPER if :TRIGger:A:WINDow:WHEN is INSIDEGreater, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (:TRIGger:A:WINDow:WIDTH) and then exits through the upper threshold. If :TRIGger:A:WINDow:WHEN is OUTSIDEGreater, the instrument triggers when the signal remains above the upper threshold for longer than the time limit (:TRIGger:A:WINDow:WIDTH) and then crosses downward through the upper threshold.

LOWER if :TRIGger:A:WINDow:WHEN is INSIDEGreater, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (:TRIGger:A:WINDow:WIDTH) and then exits through the lower threshold. If :TRIGger:A:WINDow:WHEN is OUTSIDEGreater, the instrument triggers when the signal remains below the lower threshold for longer

than the time limit (:TRIGGER:A:WINDOW:WIDTH) and then crosses upwards through the lower threshold.

EITHER if :TRIGGER:A:WINDOW:WHEN is INSIDEGreater, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (:TRIGGER:A:WINDOW:WIDTH) and then exits through either the upper or lower threshold. If :TRIGGER:A:WINDOW:WHEN is OUTSIDEGreater, the instrument triggers when the signal remains either above the upper threshold or below the lower threshold for longer than the time limit (:TRIGGER:A:WINDOW:WIDTH) and then crosses a threshold.

NONE if :TRIGGER:A:WINDOW:WHEN is INSIDEGreater, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (:TRIGGER:A:WINDOW:WIDTH) without crossing through either the upper or lower threshold. If :TRIGGER:A:WINDOW:WHEN is OUTSIDEGreater, the instrument triggers when the signal remains outside the upper and lower thresholds for longer than the time limit (:TRIGGER:A:WINDOW:WIDTH) without crossing through either the upper or lower threshold.

**Examples** SEARCH:SEARCH1:TRIGGER:A:WINDOW:CROSSING LOWER sets the CROSSING to LOWER.

SEARCH:SEARCH1:TRIGGER:A:WINDOW:CROSSING? might return SEARCH:SEARCH1:TRIGGER:A:WINDOW:CROSSING UPPER indicating that CROSSING is set to UPPER.

## SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:LOGICQUALification

This command specifies or queries whether or not to use logic qualification for a window search. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:LOGICQUALification  
{ON|OFF}  
SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:LOGICQUALification?

**Arguments** ON specifies to use logic qualification for a window search.  
OFF specifies not to use logic qualification for a window search.

**Examples** SEARCH:SEARCH1:TRIGGER:A:WINDOW:LOGICQUALification ON turns ON logic qualification for a window search.

SEARCH:SEARCH1:TRIGGER:A:WINDOW:LOGICQUALIFICATION? might return SEARCH:SEARCH1:TRIGGER:A:WINDOW:LOGICQUALIFICATION OFF indicating logic qualification is off.

## SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:POLARITY

This command sets or queries the window trigger threshold crossing of the selected trigger Source. The search number is specified by x.

**Group** Search and Mark

**Syntax** SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:POLARITY  
{UPPER|LOWER|EITHER|NONE}  
SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:POLARITY?

**Arguments** UPPER specifies that the instrument triggers when the signal remains above the upper threshold for longer than the time limit and then crosses downward through the upper threshold.

LOWER specifies that the instrument triggers when the signal remains below the lower threshold for longer than the time limit and then crosses upwards through the lower threshold.

EITHER specifies that the instrument triggers when the signal remains either above the upper threshold or below the lower threshold for longer than the time limit and then crosses a threshold.

NONE specifies that the instrument triggers when the signal remains outside the upper and lower thresholds for longer than the time limit without crossing through either the upper or lower threshold.

**Examples** SEARCH:SEARCH1:TRIGGER:A:WINDOW:POLARITY LOWER sets the polarity to lower.

SEARCH:SEARCH1:TRIGGER:A:WINDOW:POLARITY? might return SEARCH:SEARCH1:TRIGGER:A:WINDOW:POLARITY UPPER indicating the polarity is set to upper.

## SEARCH:SEARCH<x>:TRIGGER:A:WINDOW:SOURCE

This command sets and queries the source for the window search input. The search number is specified by x.

**Group** Search and Mark

|                  |                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | SEARCH:SEARCH<x>:TRIGger:A:WINDow:SOUrcE<br>{CH<x> MATH<x> REF<x>}<br>SEARCH:SEARCH<x>:TRIGger:A:WINDow:SOUrcE?                                                                                                                                                                                                                  |
| <b>Arguments</b> | CH<x> specifies an analog channel as the search source, where the channel number is specified by x.<br><br>MATH<x> specifies the math waveform as the search source, where the math number is specified by x.<br><br>REF<x> specifies the reference waveform as the search source, where the reference number is specified by x. |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGger:A:WINDow:SOUrcE CH2 sets the source to channel 2.<br><br>SEARCH:SEARCH1:TRIGger:A:WINDow:SOUrcE? might return<br>SEARCH:SEARCH1:TRIGGER:A:WINDOW:SOURCE CH3 indicating the source is channel 3.                                                                                                           |

## SEARCH:SEARCH<x>:TRIGger:A:WINDow:THReshold:HIGH

This command sets or queries the source threshold HIGH level for a transition trigger search to determine where to place a mark. The search number is specified by x.

|                  |                                                                                                                                                                                                                                                                 |

| <b>Arguments</b> | <NR3> specifies the minimum width in seconds.<br><br>ECL specifies a preset high level of -1.3 V and TTL specifies a preset high level of +1.4V.                                                                                                                                                                    |
| <b>Examples</b>  | SEARCH:SEARCH1:TRIGGER:A:WINDOW:WIDTH 400E-12 sets the window<br>trigger width setting for search 1 to 0.4 ns.<br><br>SEARCH:SEARCH1:TRIGGER:A:WINDOW:WIDTH? might return<br>SEARCH:SEARCH1:TRIGGER:A:WINDOW:WIDTH 500.0000E-12, indicating<br>that the window trigger width setting for search 1 is set to 0.5 ns. |

## SEARCH:SELEcted

This command sets or queries the selected search, for example SEARCH1. The search number is specified by x.

|                  |                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Search and Mark                                                                                                                                        |
| <b>Syntax</b>    | SEARCH:SELEcted SEARCH1                                                                                                                                |
| <b>Arguments</b> | SEARCH1 is the specified search.                                                                                                                       |
| <b>Examples</b>  | SEARCH:SELEcted SEARCH1 specifies a search 1 search.<br><br>SEARCH:SELEcted? might return :SEARCH:SELECTED SEARCH1 indicating<br>search 1 is selected. |

## SEARCHTABLE:ADDNew (No Query Form)

This command adds a new search event table in an Option 5-WIN (Microsoft Windows 10 OS) TekExpress compliance testing application.

**Group** Search and Mark

**Syntax** SEARCHTABLE:ADDNew <qstring>

**Arguments** <qstring> contains the name of the search table. "TABLE" should be the argument prefix followed by a non-zero integer.

**Examples** SEARCHTABLE:ADDNew "TABLE1" adds the TABLE1 in the display area.

## SEARCHTABLE:DELeTe (No Query Form)

This command deletes a search event table in an Option 5-WIN (Microsoft Windows 10 OS) TekExpress compliance testing application.

**Group** Search and Mark

**Syntax** SEARCHTABLE:DELeTe <qstring>

**Arguments** <qstring> contains the name of the search table. "TABLE" should be the argument prefix followed by a non-zero integer.

**Examples** SEARCHTABLE:DELeTe "TABLE1" removes the TABLE1 from the display area.

## SEARCHTABLE:list? (Query Only)

This command queries all search event table in an Option 5-WIN (Microsoft Windows 10 OS) TekExpress compliance testing application.

**Group** Search and Mark

**Syntax** SEARCHTABLE:list?

**Returns** Returns a list of all the search event tables in the display area.

**Examples** SEARCHTABLE:LIST? might return TABLE1, TABLE2, TABLE3, indicating the names of the three search event tables in the display area.

## SElect:CH<x>

Turns the display of the channel <x> waveform on or off, where <x > is the channel number. This command also resets the acquisition. The query returns whether the channel is on or off but does not indicate whether it is the specified waveform.

**Group** Vertical

**Syntax** SElect:CH<x> {ON|OFF|1|0}  
SElect:CH<x>?

**Arguments** ON turns on the display of the specified waveform. This waveform also becomes the selected waveform.

OFF turns off the display of the specified waveform.

1 turns on the display of the specified waveform. This waveform also becomes the selected waveform.

0 turns off the display of the specified waveform.

**Examples** SELECT:CH2 ON turns the channel 2 waveform display on, and selects channel 2.  
SELECT:CH1? might return :SELECT:CH1 1 indicating that channel 1 is being displayed.

## SET? (Query Only)

This query-only command returns the commands that list the instrument settings, except for configuration information for the calibration values. You can use these commands to return the instrument to the state it was in when you made the SET? query. The SET? query always returns command headers, regardless of the setting of the [HEADer](#) command. This is because the returned commands are intended to be sent back to the instrument as a command string. The [VERBose](#) command can still be used to specify whether the returned headers should be abbreviated or full-length.

This command is identical to the [\\*LRN?](#) command.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>            | Miscellaneous                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Syntax</b>           | SET?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Related Commands</b> | <a href="#">HEADer</a><br><a href="#">*LRN?</a><br><a href="#">VERBose</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## SOCKETServer:ENABle

This command enables or disables the socket server which supports a telnet or other TCPIP socket connection to send commands and queries to the instrument. The default state is enabled.

|                  |                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Miscellaneous                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>    | SOCKETServer:ENABle {0 1 OFF ON}<br>SOCKETServer:ENABle?                                                                                                                                                                                                                                                                                                                      |
| <b>Arguments</b> | 1 enables the socket server. If the state is 0 (disabled) and this command is sent to enable the socket server when the port is in use by another service, then the error event code 221 (Settings conflict) is posted to the event queue and the socket server remains disabled. In this case, select a different port number and attempt to enable the socket server again. |

0 disables the socket server.  
 ON enables the socket server.  
 OFF disables the socket server.

**Examples** SOCKETSERVER:ENABLE On enables the socket server.  
 SOCKETSERVER:ENABLE? might return :SOCKETSERVER:ENABLE 1 indicating the socket server is enabled.

## SOCKETServer:PORT

This command sets the TCPIP port for the socket server connection.

**Group** Miscellaneous

**Syntax** SOCKETServer:PORT <NR1>  
 SOCKETServer:PORT?

**Arguments** <NR1> is the TCPIP port for the socket server connection.  
 If the socket server is enabled and the port specified is in use by another service, then the error event code 221 (Settings conflict) is posted to the event queue and the socket server remains in its current state (i.e. enabled/disabled and port address remain unchanged).  
 Similarly, if any sessions are active when the port is changed, this same error event may be posted to the event queue and the port will remain unchanged. In this case, exit all current sessions and send the :SOCKETServer:PORT command again.

**Examples** SOCKETSERVER:PORT 4000 sets the socket server port number to 4000.  
 SOCKETSERVER:PORT? might return :SOCKETSERVER:PORT 4000 indicating that the port number is 4000.

## SOCKETServer:PROTOCOL

This command sets or queries the protocol for the socket server.

**Group** Miscellaneous

**Syntax** SOCKETServer:PROTOCOL {TERMiNa1|NONE}  
 SOCKETServer:PROTOCOL?

**Arguments** TERMiNa1 specifies terminal protocol for the socket server. When set to TERMiNa1, a session startup message is sent to the socket and a command prompt is provided.

NONE disables the terminal features, allowing the server to be used for raw socket transactions, such as with a VISA socket server. The default setting is NONE.

**Examples** SOCKETSERVER:PROTOCOL NONE sets the protocol to none.

SOCKETSERVER:PROTOCOL? might return :SOCKETSERVER:PROTOCOL TERMINAL indicating the protocol is set to terminal.

## \*SRE

The \*SRE (Service Request Enable) command sets and queries the bits in the Service Request Enable Register. For more information, refer to Registers.

**Group** Status and Error

**Syntax** \*SRE <NR1>  
 \*SRE?

**Related Commands** [\\*CLS](#)  
[DESE](#)  
[\\*ESE](#)  
[\\*ESR?](#)  
[EVENT?](#)  
[EVMsg?](#)  
[FACTory](#)  
[\\*STB?](#)

**Arguments** <NR1> is a value in the range from 0 through 255. The binary bits of the SRER are set according to this value. Using an out-of-range value causes an execution error. The power-on default for SRER is 0 if \*PSC is 1. If \*PSC is 0, the SRER maintains the previous power cycle value through the current power cycle.

**Examples** \*SRE 48 sets the bits in the SRER to binary 00110000.  
 \*SRE? might return 32, showing that the bits in the SRER have the binary value of 00100000.

## \*STB? (Query Only)

The \*STB? (Read Status Byte) query returns the contents of the Status Byte Register (SBR) using the Master Summary Status (MSS) bit. For more information, refer to Registers.

**Group** Status and Error

**Syntax** \*STB?

**Related Commands** [\\*CLS](#)  
[DESE](#)  
[\\*ESE](#)  
[\\*ESR?](#)  
[EVENT?](#)  
[EVMsg?](#)  
[FACtory](#)  
[\\*SRE](#)

**Returns** <NR1>

**Examples** \*STB? might return 96, showing that the SBR contains the binary value 01100000.

## SV:CH<x>:RF\_AVErage:NUMAVg

This command sets or queries the number of acquisitions to be used when creating the Average trace for the specified spectrum trace channel in the Spectrum View. The Average spectrum trace shows the average of values from multiple acquisitions at each trace point.

**Group** Spectrum View

**Syntax**     SV:CH<x>:RF\_AVErAge:NUMAVg <NR1>  
              SV:CH<x>:RF\_AVErAge:NUMAVg?

**Arguments**   CH<x> specifies the spectrum trace channel source.  
  
              <NR1> specifies the number of acquisitions to average. The range is 2 - 512, in exponential increments.

**Examples**     SV:CH1:RF\_AVErAge:NUMAVg 100 sets the number of acquisitions to use for the Average spectrum trace of channel 1 to 128 (the closest power of 2 increment).  
  
              SV:CH2:RF\_AVErAge:NUMAVg? might return 16, indicating that the number of averages for the channel 2 Average spectrum trace is set to 16.

## SV:CH<x>:RF\_MAGNitude:FORMat

This command sets or queries the format of the Magnitude vs. Time trace for the specified channel.

**Conditions**   Requires option SV-RFVT

**Group**        Spectrum View

**Syntax**       SV:CH<x>:RF\_MAGNitude:FORMat {AMPLINear|POWLINear|POWLOG}  
              SV:CH<x>:RF\_MAGNitude:FORMat?

**Related Commands**   [DISplay:WAVEView<x>:RF\\_PHASe<x>:VERTical:POSition](#)

**Arguments**   CH<x> is the channel number of the Magnitude vs. Time trace.  
  
              AMPLINear (Amplitude (linear)) sets the magnitude in Volts with square root conversion of linear power values.  
  
              POWLINear (Power (linear)) sets the magnitude in Watts with direct use of linear power values.  
  
              POWLOG (Power (log)) sets the magnitude in dB using log conversion of linear power values.

**Examples**     SV:CH2:RF\_MAGNitude:FORMat AMPLINear sets the Channel 2 Magnitude vs. Time trace to be shown with linear power values.

SV:CH1:RF\_MAGNitude:FORMat? might return  
 SV:CH1:RF\_MAGNitude:FORMat POWLOG, indicating that the Channel 1  
 Magnitude vs. Time trace is displayed with log power values.

## SV:CH<x>:RF\_PHASE:REFerence:DEGrees

This command sets or queries the channel Phase Reference value in degrees.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

**Syntax** SV:CH<x>:RF\_PHASE:REFerence:DEGrees <NR3>  
 SV:CH<x>:RF\_PHASE:REFerence:DEGrees?

**Related Commands** [SV:CH<x>:RF\\_PHASE:REFerence:TIME](#), [SV:CH<x>:RF\\_PHASE:REFerence:POSition](#), [SV:RF\\_PHASE:REFerence:MASTer](#)

**Arguments** CH<x> is the channel number of the Phase vs. Time trace.  
 <NR3> is the Phase Reference value, in degrees. This indicates a fixed phase value at the phase time set by SV:CH<x>:RF\_PHASE:REFerence:TIME. If CH<x> is the master phase reference, then the value is used to calculate the phase values of all other channels.

**Examples** SV:CH1:RF\_PHASE:REFerence:DEGrees 25 sets the Phase Reference value to 25 degrees.

SV:CH2:RF\_PHASE:REFerence:DEGrees? might return  
 SV:CH2:RF\_PHASE:REFerence:DEGrees 0, indicating that the  
 Phase Reference value is 0 degrees.

## SV:CH<x>:RF\_PHASE:REFerence:POSition

This command sets or queries whether the channel Phase Reference is located at the Trigger position or at the Cursor A position.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

| <b>Arguments</b>        | CH<x> is the channel number of the Phase vs. Time trace.<br><br><NR3> is the Phase Reference time, in seconds. This indicates the time at which the phase value set by SV:CH<x>:RF_PHASE:REfERENCE:DEGrees is applied. If the phase position set by SV:CH<x>:RF_PHASE:REfERENCE:POsITION is TRIGger, then the phase time is fixed at 0 seconds and cannot be changed. If the phase position is CURSor, then the phase time may be set to any value, and is |

initialized to the position of Cursor A. If CH<x> is the master phase reference, then the time is used to calculate the phase values of all other channels.

**Examples** `SV:CH1:RF_PHASE:REFERENCE:TIME 25e-9` sets the Phase Reference time to 25 ns.

`SV:CH2:RF_PHASE:REFERENCE:TIME?` might return  
`SV:CH2:RF_PHASE:REFERENCE:TIME 0`, indicating that the Phase Reference time is 0 seconds.

## SV:CH<x>:RF\_PHASE:WRAP:DEGREES

This command sets or queries the Phase Wrap limit for the Phase vs. Time trace for the specified channel.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

**Syntax** `SV:CH<x>:RF_PHASE:WRAP:DEGREES <NR3>`  
`SV:CH<x>:RF_PHASE:WRAP:DEGREES?`

**Arguments** CH<x> is the channel number of the Phase vs. Time trace.  
 <NR3> sets the number of wrap degrees, from 180 degrees to infinity. When Phase Wrap is enabled, the phase values in the Phase vs Time waveform are constrained to be within  $\pm$  the specified limit. Phase values below or above the limit are wrapped by repeatedly adding or subtracting 360 degrees until they are within range.

**Examples** `SV:CH2:RF_PHASE:WRAP:DEGREES 200` sets the Phase Wrap limit for the Channel 2 Phase vs. Time trace to 200 degrees.  
`SV:CH1:RF_PHASE:WRAP:DEGREES?` might return  
`SV:CH1:RF_PHASE:WRAP:DEGREES 210`, indicating that the Phase Wrap limit for the Channel 1 Phase vs. Time trace is 210 degrees.

## SV:CH<x>:RF\_PHASE:WRAP:STATE

This command sets or queries whether Phase Wrap is applied to the Phase vs. Time trace for the specified channel.

|                   |                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SV-RFVT                                                                                                                                                                                                                                                       |
| <b>Group</b>      | Spectrum View                                                                                                                                                                                                                                                                 |

**SV:CH<x>:SElect:RF\_NORMAL**

This command sets or queries whether the Normal trace is displayed for the specified spectrum trace channel in the Spectrum View.

|                  |                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Spectrum View                                                                                                                                               |
| <b>Syntax</b>    | SV:CH<x>:SElect:RF_NORMAL {ON 1 OFF 0}<br>SV:CH<x>:SElect:RF_NORMAL?                                                                                        |
| <b>Arguments</b> | <p>CH&lt;x&gt; specifies the spectrum trace channel source.</p> <p>ON enables the display of the Normal trace for the specified spectrum trace channel.</p> |

OFF disables the display of the Normal trace for the specified spectrum trace channel.

1 enables the display of the Normal trace for the specified spectrum trace channel.

0 disables the display of the Normal trace for the specified spectrum trace channel.

**Examples** `SV:CH3:SElect:RF_NORMa1 ON` turns on the display of the Average trace for the channel 3 spectrum trace.

`SV:CH1:SElect:RF_NORMa1?` might return 0, indicating that the Average trace for the channel 1 spectrum trace is turned off.

## SV:CH<x>:SElect:RF\_PHASE

This command sets or queries whether the Phase vs. Time trace for the specified channel is displayed in the Waveform View.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

**Syntax** `SV:CH<x>:SElect:RF_PHASE {ON|OFF}`  
`SV:CH<x>:SElect:RF_PHASE?`

**Arguments** CH<x> is the channel number of the Phase vs. Time trace.

ON enables display of the Phase vs. Time trace.

OFF disables display of the Phase vs. Time trace.

**Examples** `SV:CH4:SElect:RF_PHASE ON` turns on (enables) display of the Channel 4 Phase vs. Time trace.

`SV:CH1:SElect:RF_PHASE?` might return `SV:CH1:SElect:RF_PHASE OFF`, indicating that the Channel 1 Phase vs. Time trace is not displayed.

## SV:CH<x>:SElect:SPECTrogram

This command sets or queries whether the spectrogram plot for the specified channel is displayed in the Spectrum View. The channel number is specified by x.

**Conditions** Requires option SV-RFVT

|                  |                                                                                                                                      |

| <b>Syntax</b>    | SV:CH<x>:SELEct:SPECTrogram {ON OFF}<br>SV:CH<x>:SELEct:SPECTrogram?                                                                 |
| <b>Arguments</b> | ON turns on spectrogram<br>OFF turns of spectrogram.                                                                                 |
| <b>Examples</b>  | SV:CH4:SELEct:SPECTrogram ON turns on spectrogram.<br>SV:CH4:SELEct:SPECTrogram? might return ON, indicating that spectrogram is on. |

## SV:CH<x>:SELTrace

This command sets or queries the spectrum trace type to show for the specified channel in the Spectrum View. Each channel's spectrum trace can display up to four traces; a Normal trace (default), a Max Hold trace, a Min Hold trace and an Average trace.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Spectrum View                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Syntax</b>    | SV:CH<x>:SELTrace {NORMa1 MAXHO1d MINHO1d AVERage}<br>SV:CH<x>:SELTrace?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Arguments</b> | CH<x> specifies the analog channel to use as the Spectrum View source.<br><br>NORMa1 selects the Normal trace for the specified spectrum trace channel. If the specified spectrum trace channel does not have a Normal trace, this command is ignored.<br><br>MAXHO1d selects the Max Hold trace for the specified spectrum trace channel. If the specified spectrum trace channel does not have a Max Hold trace, this command is ignored.<br><br>MINHO1d selects the Min Hold trace for the specified spectrum trace channel. If the specified spectrum trace channel does not have a Min Hold trace, this command is ignored.<br><br>AVERage selects the Average trace for the specified spectrum trace channel. If the specified spectrum trace channel does not have an Average trace, this command is ignored. |

- Examples**    `SV:CH1:SELTrace MAXhold` selects the Max Hold trace of the channel 1 spectrum trace in the Spectrum View.
- `SV:CH1:SELTrace?` might return `AVE`, indicating that the Average trace of the channel 1 spectrum trace is currently selected in the Spectrum View.

## **SV:CH<x>:SQUELCH:STATE**

This command sets or queries whether Squelch is enabled for the RF vs Time traces for the specified channel. The frequency vs. time and phase vs. time traces aren't meaningful when the transmitting signal is turned off, as they just show broadband noise that clutters up the display. With squelch, a threshold may be defined for the magnitude vs. time trace to indicate when the transmitter is on/off. Then the frequency and phase vs. time traces are shown only when the magnitude vs. time trace is above the threshold and they are blanked out when it's below the threshold.

- Conditions**    Requires option `SV-RFVT`
- Group**        Spectrum View
- Syntax**        `SV:CH<x>:SQUELCH:STATE {ON|OFF}`  
`SV:CH<x>:SQUELCH:STATE?`
- Related Commands**    [SV:CH<x>:SQUELCH:THRshold](#)
- Arguments**    `CH<x>` is the channel number of the Frequency or Phase vs. Time trace.  
`ON` enables (turns on) Squelch calculations.  
`OFF` disables (turns off) Squelch calculations.
- Examples**        `SV:CH6:SQUELCH:STATE ON` turns on Squelch calculations for the RF vs. Time traces of Channel 6.
- `SV:CH1:SQUELCH:STATE?` might return `SV:CH1:SQUELCH:STATE OFF`, indicating that Squelch calculations are turned off for the RF vs. Time traces of Channel 1

## **SV:CH<x>:SQUELCH:THRshold**

This command sets or queries the Squelch threshold value for the RF vs Time traces for the specified channel.

|                         |                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SV-RFVT                                                                                                                                                                                                                                                                     |

| <b>Related Commands</b> | <a href="#">SV:CH&lt;x&gt;:SQUELCH:STATE</a>                                                                                                                                                                                                                                                |
| <b>Arguments</b>        | CH<x> is the channel number of the Magnitude vs. Time trace.<br><br><NR3> sets the threshold value, in volts, applied to the Magnitude vs. Time trace that determines whether or not to show the Frequency and Phase vs. Time traces for the same channel.                                  |
| <b>Examples</b>         | SV:CH5:SQUELCH:THResho1d 0.5 sets the Squelch Threshold value to 0.5 volts for the RF vs Time traces of Channel 5.<br><br>SV:CH1:SQUELCH:THResho1d? might return SV:CH1:SQUELCH:THResho1d 1.25, indicating a Squelch Threshold value of 1.25 Volts for the RF vs. Time traces of Channel 1. |

## SV:CH<x>:UNIts

This command sets or queries the absolute logarithmic amplitude vertical scale units to show in the specified spectrum trace channel of the Spectrum View.

|                  |                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Spectrum View                                                                                                                                                                                                                                                                                                                           |
| <b>Syntax</b>    | SV:CH<x>:UNIts {DBM DBUW DBmV DBuV DBmA DBUA}<br>SV:CH<x>:UNIts?                                                                                                                                                                                                                                                                        |
| <b>Arguments</b> | CH<x> specifies the analog channel to use as the Spectrum View source.<br><br>DBM specifies Decibel milliwatts (dBm).<br><br>DBUW specifies Decibel microwatts (dB $\mu$ W).<br><br>DBmV specifies Decibel millivolts (dBmV).<br><br>DBuV specifies Decibel microvolts (dB $\mu$ V).<br><br>DBmA specifies Decibel milliamperes (dBmA). |

DBUA specifies Decibel microamperes (dB $\mu$ A).

**Examples** `SV:CH5:UNITs DBUV` sets the units to be used for the channel 5 spectrum trace to decibel microvolts.

`SV:CH1:UNITs?` might return `DBM`, indicating that the vertical units for the channel 1 spectrum trace are decibel milliwatts.

## SV:LOCKCenter

This command sets or queries whether the Center Frequency setting is locked across all channels in the Spectrum View.

**Group** Spectrum View

**Syntax** `SV:LOCKCenter {ON|1|OFF|0}`  
`SV:LOCKCenter?`

**Related Commands** [CH<x>:SV:CENTERFrequency](#)

**Arguments** `ON` sets all spectrum traces channels in the Spectrum View window to use the same center frequency value. When the center frequency of any channel is changed, the center frequency of all other channels is automatically changed to match that value.

`1` sets all spectrum traces channels in the Spectrum View window to use the same center frequency value. When the center frequency of any channel is changed, the center frequency of all other channels is automatically changed to match that value.

`0` enables use of different center frequency values for each spectrum trace channel. The center frequencies of all channels are independent.

`OFF` enables use of different center frequency values for each spectrum trace channel. The center frequencies of all channels are independent.

**Examples** `SV:LOCKCenter ON` locks all spectrum trace channels to the same center frequency.

`SV:LOCKCenter?` might return `0`, which indicates that each spectrum trace channel may have an independent center frequency setting.

## SV:LOCKSppectrum

This command sets or queries whether the Spectrum Time value is locked across all spectrum trace channels in the Spectrum View.

**Group** Spectrum View

**Syntax** SV:LOCKSppectrum {ON|1|OFF|0}  
SV:LOCKSppectrum?

**Related Commands** [CH<x>:SV:POSition](#)

**Arguments** ON sets all spectrum traces channels in the Spectrum View window to use the same Spectrum Time value. When the Spectrum Time of any channel is changed, the Spectrum Time of all other channels is automatically changed to match that value.

1 sets all spectrum traces channels in the Spectrum View window to use the same Spectrum Time value. When the Spectrum Time of any channel is changed, the Spectrum Time of all other channels is automatically changed to match that value.

0 enables use of different Spectrum Time values for each spectrum trace channel. The Spectrum Time of all channels are independent.

OFF enables use of different Spectrum Time values for each spectrum trace channel. The Spectrum Time of all channels are independent.

**Examples** SV:LOCKSppectrum ON sets all spectrum trace channels to use the same spectrum time.

SV:LOCKSppectrum? might return 0, which indicates each channel may have an independent Spectrum Time setting.

## SV:MARKER:PEAK:EXCURsion

This command sets or queries the minimum peak excursion value, in dB, for the Spectrum View trace peak markers.

Peak excursion refers to the minimum amount a spectrum signal needs to fall in amplitude between marked peaks to be considered another valid peak. If the peak excursion value is low, more peaks will tend to qualify as valid peaks and have associated markers. If the peak excursion value is high, fewer peaks will have associated markers.

**Group** Spectrum View

**Syntax**     `SV:MARKER:PEAK:EXCURsion <NR3>`  
`SV:MARKER:PEAK:EXCURsion?`

**Arguments**     `<NR3>` specifies the peak marker excursion value in dB. The range of values is 0.0 dB to 200.0 dB.

**Examples**     `SV:MARKER:PEAK:EXCURsion 12` sets the peak excursion value to 12 dB.  
`SV:MARKER:PEAK:EXCURsion?` might return `30.00`, indicating that a peak must exceed 30 dB change from other marked peaks to be marked with a peak indicator icon.

## SV:MARKER:PEAK:MAXimum

This command sets or queries the maximum number of Spectrum View peak markers that can be placed on spectrum traces.

the Spectrum View window can show between 1 and 11 peak markers on all spectrum traces. The default is 5. To turn on the peak markers, use the command `SV:MARKER:PEAK:STATE`. The actual number of peak markers may be less than the maximum, depending on the threshold and excursion values and the spectral content of the RF signal. If more peaks than the maximum are detected that meet the threshold and excursion criteria, only the highest amplitude peaks will have markers placed on them.

**Group**     Spectrum View

**Syntax**     `SV:MARKER:PEAK:MAXimum <NR1>`  
`SV:MARKER:PEAK:MAXimum?`

**Related Commands**     [SV:MARKER:PEAK:STATE](#)

**Arguments**     `<NR1>` is an integer value that specifies the maximum number of peak markers to display on spectrum traces. The range of values is 1 to 11.

**Examples**     `SV:MARKER:PEAK:MAXimum 3` sets the maximum number of peaks that can have markers to three.

`SV:MARKER:PEAK:MAXimum?` might return `7`, indicating that the maximum number of peaks that can have markers is set to seven.

## SV:MARKER:PEAK:STATE

This command sets or queries showing peak markers on spectrum traces in the Spectrum View window.

There are up to 11 markers. The maximum number of markers can be set using the command SV:MARKER:PEAK:MAXimum. The peak markers find amplitude peaks based upon threshold and excursion settings (set with the SV:MARKER:PEAK:EXCURsion and SV:MARKER:PEAK:THReshold commands.) Each peak marker has a readout associated with it. These can be absolute or delta readouts (set with the SV:MARKER:TYPE command.)

**Group** Spectrum View

**Syntax** SV:MARKER:PEAK:STATE {ON|1|OFF|0}  
SV:MARKER:PEAK:STATE?

**Related Commands** [SV:MARKER:PEAK:MAXimum](#)  
[SV:MARKER:PEAK:EXCURsion](#)  
[SV:MARKER:PEAK:THReshold](#)  
[SV:MARKER:TYPE](#)

**Arguments** 1 enables showing peak marker icons on spectrum trace waveforms.  
ON enables showing peak marker icons on spectrum trace waveforms.  
0 disables showing peak marker icons on spectrum trace waveforms.  
OFF disables showing peak marker icons on spectrum trace waveforms.

**Examples** SV:MARKER:PEAK:STATE 1 turns the peak markers on.  
SV:MARKER:PEAK:STATE? might return 0, indicating that peak markers are turned off.

## SV:MARKER:PEAK:THReshold

This command sets or queries the minimum peak threshold value required to mark a peak. Only peaks with an amplitude greater than the threshold value will qualify for peak marker placement. Applies to all spectrum traces, and to each trace in its own vertical units.

**Group** Spectrum View

**Syntax**     `SV:MARKER:PEAK:THResho1d <NR3>`  
`SV:MARKER:PEAK:THResho1d?`

**Related Commands**     [SV:CH<x>:UNIIts](#)

**Arguments**     <NR3> specifies the peak marker threshold value. The range of values is -200.0 to 200.0.

**Examples**     `SV:MARKER:PEAK:THResho1d -40` sets the peak marker threshold to -40 dBm.  
`SV:MARKER:PEAK:THResho1d?` might return `-50.00`, indicating that only peaks with an amplitude greater than -50 dBm qualify for peak marker placement.

## SV:MARKER:PEAKS:AMPLITUDE? (Query Only)

This command queries the peak amplitudes for the Spectrum View trace peak markers.

**Group**     Spectrum View

**Syntax**     `SV:MARKER:PEAKS:AMPLITUDE?`

**Returns**     Returns the peak amplitudes in a comma separated list.

**Examples**     `SV:MARKER:PEAKS:AMPLITUDE?` might return  
`"-59.9311294555664, -67.5772018432617, -66.0407104492188, -69.4306945800781"`  
indicating that a peak amplitudes are -59.9311294555664, -67.5772018432617, -66.0407104492188, -69.4306945800781, and -62.5529403686523.

## SV:MARKER:PEAKS:FREQUency? (Query Only)

This command queries the peak frequencies for the Spectrum View trace peak markers.

**Group**     Spectrum View

**Syntax**     `SV:MARKER:PEAKS:FREQUency?`

**Returns** Returns the peak frequencies in a comma separated list.

**Examples** `SV:MARKER:PEAKS:FREQUENCY?` might return  
"781.2605289757411E+6,906.0288915094338E+6,946.8286725067385E+6,1.02  
indicating that a peak frequencies are 781.2605289757411E+6,  
906.0288915094338E+6, 946.8286725067385E+6, and  
1.026059214960E+9,1.1718855289757E+9.

## SV:MARKER:REFERENCE (No Query Form)

This command sets the Center Frequency of the currently selected Spectrum View channel to the frequency indicated by the Reference Marker, in effect moving the Reference Marker to the center of the screen.

**Group** Spectrum View

**Syntax** `SV:MARKER:REFERENCE`

**Related Commands** [SV:CH<x>:UNITS](#)

**Examples** `SV:MARKER:REFERENCE` moves the Reference Marker location to the center of the screen.

## SV:MARKER:REFERENCE:AMPLITUDE? (Query Only)

This command queries the amplitude (vertical) value of the Reference Marker in user-set units. This value indicates the absolute amplitude of the Reference Marker, regardless of whether the other markers are manual or automatic.

**Group** Spectrum View

**Syntax** `SV:MARKER:REFERENCE:AMPLITUDE?`

**Related Commands** [SV:CH<x>:UNITS](#)

**Returns** <NR3> specifies the amplitude of the Reference Marker.

**Examples** `SV:MARKER:REFERENCE:AMPLITUDE?` might return `-65.6218`, indicating an amplitude value of `-65.6218` dBm.

## **SV:MARKER:REFERENCE:FREQUENCY? (Query Only)**

This command queries the frequency of the Reference Marker, in Hz, when the Spectrum View trace markers are on.

**Group** Spectrum View

**Syntax** `SV:MARKER:REFERENCE:FREQUENCY?`

**Returns** `<NR3>` specifies the frequency of the Reference Marker.

**Examples** `SV:MARKER:REFERENCE:FREQUENCY?` might return `1.6830E+9`, indicating that the Reference Marker frequency is `1.683` GHz.

## **SV:MARKER:TYPE**

This command sets or queries the peak marker type (either `DELTA` or `ABSOLUTE`).

An Absolute marker shows the frequency and amplitude at the location of the marker. A Delta marker shows the frequency and amplitude of the marker relative to the Reference Marker. The Reference Marker shows the absolute frequency and amplitude, regardless of this command. The marker amplitude measurements are in dBm for Absolute, or in dBc (dB below carrier amplitude) for Delta.

**Group** Spectrum View

**Syntax** `SV:MARKER:TYPE {DELTA|ABSOLUTE}`  
`SV:MARKER:TYPE?`

**Arguments** `DELTA` specifies to display the frequency and amplitude of the peak markers relative to the Reference Marker. The relative amplitude is in dBc (dB below carrier amplitude); the relative frequency is in Hz.

`ABSOLUTE` specifies to display the actual frequency and amplitude of each peak marker. The absolute amplitude is in user-set units; the absolute frequency is in Hz.

**Examples** `SV:MARKER:TYPE DELta` changes the marker type to Delta.

`SV:MARKER:TYPE?` might return `ABSOLUTE`, indicating that the peak markers are measuring the absolute values of the spectrum trace at those positions.

## SV:RBW

This command sets or queries the resolution bandwidth (RBW) when the RBW mode has been set to `MANUAL` (using the command `SV:RBWMode`).

The resolution bandwidth is the width of the narrowest measurable band of frequencies in a Spectrum View trace. By default, the RBW tracks the span value in a 1000:1 ratio. The RBW determines the level to which the instrument can resolve individual frequencies in the frequency domain. For example, if the input signal contains two carriers separated by 1 kHz, you will not be able to discriminate between them unless the RBW is less than 1 kHz.

**Group** Spectrum View

**Syntax** `SV:RBW <NR3>`  
`SV:RBW?`

**Related Commands** [SV:RBWMode](#)

**Arguments** `<NR3>` specifies the width of the narrowest measurable band of frequencies in a Spectrum View trace, in Hz.

**Examples** `SV:RBW 2.0E+04` sets the RBW to 20 kHz.

`SV:RBW?` might return `3.0E+6`, indicating that the RBW has been set to 3 MHz.

## SV:RBWMode

This command sets or queries the resolution bandwidth (RBW) mode, either Automatic or Manual.

**Group** Spectrum View

**Syntax** `SV:RBWMode {AUTOMATIC|MANUAL}`  
`SV:RBWMode?`

**Related Commands**    [SV:RBW](#)  
[SV:SPANRBWRatio](#)

**Arguments**    **AUTOMATIC** specifies the resolution bandwidth automatically as the span is changed. The default behavior is 1000:1, but you can set it to other values in a 1-2-5 sequence (e.g. 10000, 20000, 50000). To specify the RBW ratio that will be used when the mode is set to automatic, use the command **SV:SPANRBWRatio**.

**MANUAL** specifies to set the resolution bandwidth, independently from the span, using the command **SV:RBW**.

**Examples**    **SV:RBWMode MANUAL** sets the RBW mode to Manual.  
**SV:RBWMode?** might return **AUTO**, indicating that the RBW mode is set to Automatic mode (default).

## SV:RF\_PHASE:REFERENCE:MASTER

This command sets or queries the channel used as the Master Phase Reference.

**Conditions**    Requires option **SV-RFVT**

**Group**    Spectrum View

**Syntax**    **SV:RF\_PHASE:REFERENCE:MASTER {CH<x> | NONE}**  
**SV:RF\_PHASE:REFERENCE:MASTER?**

**Arguments**    **CH<x>** sets the specified channel as the Master Phase Reference source.  
**NONE** indicates that there is no Master Phase Reference.

**Examples**    **SV:RF\_PHASE:REFERENCE:MASTER CH3** sets the Master Phase Reference source to Channel 3.  
**SV:RF\_PHASE:REFERENCE:MASTER?** might return  
**SV:RF\_PHASE:REFERENCE:MASTER NONE**, indicating that there is no Master Phase Reference.

## SV:SPAN

This command sets or queries the span setting for all channels in the Spectrum View. The span is the range of frequencies that can be observed centered on the

center frequency. This is the width of the frequency domain trace, which is from the center frequency  $- \frac{1}{2}\text{span}$  to the center frequency  $+ \frac{1}{2}\text{span}$ .

|                  |                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Spectrum View                                                                                              |
| <b>Syntax</b>    | SV:SPAN <NR3><br>SV:SPAN?                                                                                  |
| <b>Arguments</b> | <NR3> specifies the span value in Hz.                                                                      |
| <b>Examples</b>  | SV:SPAN 2E+9 sets the span to 2 GHz.<br>SV:SPAN? might return 10.0E+6, indicating that the span is 10 MHz. |

## SV:SPANRBWRatio

This command sets or queries the ratio of the span to the resolution bandwidth (RBW) that will be used when the RBW Mode is set to AUTO.

The span is the width of the frequency domain trace in Hz, which is equal to the stop frequency minus the start frequency. The RBW is the width of the narrowest measurable band of frequencies in a frequency domain trace. The default RBW ratio is 1000 : 1.

Use the command SV:RBWMode to set the RBW Mode to Automatic.

|                         |                                                                                                                                                                                    |

| <b>Related Commands</b> | <a href="#">SV:RBWMode</a>                                                                                                                                                         |
| <b>Arguments</b>        | <NR3> specifies the span-to-RBW ratio.                                                                                                                                             |
| <b>Examples</b>         | SV:SPANRBWRatio 1000 sets the RBW to one one-thousandth of the span.<br>SV:SPANRBWRatio? might return 1.00E+3, which means the RBW has been set to one one-thousandth of the span. |

## SV:SPECTrogram:CSCale:MAX

This command sets or queries the maximum color scale value. Maximum must be > Minimum. Thus, if the user is adjusting Maximum down to the point where it would be the same as Minimum, then Minimum begins decrementing as needed to stay 1 dB below Maximum.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

**Syntax** SV:SPECTrogram:CSCale:MAX <NR3>  
SV:SPECTrogram:CSCale:MAX?

**Arguments** <NR3> sets the maximum color scale value. The default value is 0.0 and the valid range is -169.0 to 100.0

**Examples** SV:SPECTrogram:CSCale:MAX 0 sets the color scale max value to 0.  
SV:SPECTrogram:CSCale:MAX? might return  
SV:SPECTrogram:CSCale:MAX 0, indicating that the color scale max value is 0.

## SV:SPECTrogram:CSCale:MIN

This command sets or queries the minimum color scale value. Minimum must be < Maximum. Thus, if the user is adjusting Minimum up to the point where it would be the same as Minimum, then Maximum begins incrementing as needed to stay 1 dB above minimum.

**Conditions** Requires option SV-RFVT

**Group** Spectrum View

**Syntax** SV:SPECTrogram:CSCale:MIN <NR3>  
SV:SPECTrogram:CSCale:MIN?

**Related Commands** [SV:CH<x>:SElect:SPECTrogram](#)

|                  |                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <NR3> sets the minimum color scale value. The default value is -100.0 and the valid range is -170.0 to 99.0                                                                                                                 |
| <b>Examples</b>  | <p>SV:SPECTrogram:CScale:MAX -100.0 sets the color scale min value to -100.0.</p> <p>SV:SPECTrogram:CScale:MAX? might return<br/>SV:SPECTrogram:CScale:MAX -100.0, indicating that the color scale min value is -100.0.</p> |

## SV:SPECTrogram:CURSOR:A

This command sets or Queries whether the spectrum trace at cursor A position is selected or not.

|                         |                                                                             |

## SV:WINDOW

This command sets or queries the window type used by the windowing function of the Spectrum View. The windowing function is a Fast Fourier Transform (FFT) technique used to minimize the discontinuities between successive frames of an RF time domain signal. The default window type is Blackman-Harris.

|                  |                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Spectrum View                                                                                                                                                                                                                |
| <b>Syntax</b>    | SV:WINDOW {KAISerbessel RECTangular HAMMING HANNing BLACKmanharris FLATtop2}<br>SV:WINDOW?                                                                                                                                   |
| <b>Arguments</b> | KAISerbessel specifies the Kaiser-Bessel window type (a high or moderate resolution window).<br><br>RECTangular specifies the Rectangular window type (a window function is equivalent to multiplying all gate data by one). |

**HAMming** specifies the Hamming window type (a high or moderate resolution window based on a cosine series).

**HANNing** specifies the Hanning window type (a high or moderate resolution window based on a cosine series).

**BLACKmanharris** specifies the Blackman-Harris window type (a low-resolution (high dynamic range) window based on a cosine series).

**FLATtop2** specifies the Flattop2 window type (a low-resolution (high dynamic range) window).

**Examples** `SV:WINDOW BLACKmanharris` sets the window to Blackman-Harris.

`SV:WINDOW?` might return `KAISER`, indicating that the window function is set to Kaiser-Bessel.

## TEKSecure (No Query Form)

This command initializes, for the current user, both waveform and setup memories, overwriting any previously stored data.

Equivalent to invoking Teksecure from the Utility menu. This is a time-consuming operation (3 to 5 minutes) and the instrument is inoperable until the TekSecure operation is complete.

**Group** Miscellaneous

**Syntax** `TEKSecure`

**Examples** `TEKSECURE` initializes both waveform and setup memories.

## TIME

This command sets the time in the form *hh:mm:ss* where *hh* refers to a two-digit hour number, *mm* refers to a two-digit minute number from 01 to 60, and *ss* refers to a two-digit second number from 01 to 60.

**Conditions** Time can only be changed in increments of 1 hour maximum.

There is a 24-hour total time change limit. Time changes cannot cross the 00:00:00 boundary.

On Linux, if an internet connection is present, any time changes are automatically overridden by the NTP server. This also resets the 24-hour time change limit.

On Windows, this command only succeeds if the scope application was started with administrator privileges.

**Group** Miscellaneous

**Syntax** TIME <QString>  
TIME?

**Related Commands** [DATE?](#)

**Arguments** <QString> is a quoted string representing the desired time.

**Examples** TIME "13:02:10" sets the time to 1:02 p.m. and 10 seconds.

TIME? might return :TIME "14:05:17", indicating the current time is set to 2:05 p.m. and 17 seconds.

## TIME:ZONE

This command sets the time zone to the one specified.

**Group** Miscellaneous

**Syntax** TIME:ZONE <QString>  
TIME:ZONE?

**Arguments** <QString> is a quoted string representing the desired time zone.

**Examples** TIME:ZONE "America/Yellowknife" sets the time zone to UTC delta -7.

TIME:ZONE? might return :TIME:ZONE "America/Los\_Angeles".

## TIME:ZONE:UTCDELTA

This command sets or queries the time zone using the difference between the desired time zone and UTC.

**Group** Miscellaneous

**Syntax** TIME:ZONE:UTCDELTA <NR3>  
TIME:ZONE:UTCDELTA?

**Arguments** <NR3> is the specified number of hours difference between the desired time zone and UTC which is equivalent to GMT. The deltas supported are: -12.00, -11.00, -10.00, -9.30, -9.00, -8.30, -8.00, -7.00, -6.00, -5.00, -4.00, -3.30, -3.00, -2.00, -1.00, 0.0, 1.00, 2.00, 3.00, 3.30, 4.00, 4.30, 5.00, 5.30, 6.00, 6.30, 7.00, 8.00, 9.00, 9.30, 10.00, 10.30, 11.00, 11.30, 12.00

**Examples** TIME:ZONE:UTCDELTA -7.0e0 sets the time zone to America/Yellowknife.  
TIME:ZONE:UTCDELTA? might return :TIME:ZONE:UTCDELTA -8.0000.

## TOTALuptime? (Query Only)

Total number of hours the instrument has been turned on since the NV memory was last programmed, usually during the initial manufacturing process.

**Group** Miscellaneous

**Syntax** TOTALuptime?

**Returns** The total number of hours the instrument has been turned on since the NV memory was last programmed.

**Examples** TOTALUPTIME? might return :TOTALUPTIME 756 indicating the up time is 756 minutes.

## TOUCHSCREEN:CALibrate (No Query Form)

This command launches the touch screen calibration procedure. This command is equivalent to tapping the Calibrate touch screen control in the Utility->Self Test menu.

**Group** Self Test

**Syntax** TOUCHSCREEN:CALibrate START

**Arguments** START launches the touch screen calibration procedure.

**Examples** TOUCHSCREEN:CALIBRATE START launches the touch screen calibration procedure.

## TOUCHSCReen:STATe

This sets or queries the enabled state of the touch screen only. This command is equivalent to pushing the Touch Off button on the front panel.

To completely disable front panel operation, use the command LOCK ALL. To re-enable the front panel, send the command LOCK NONE.

**Group** Miscellaneous

**Syntax** TOUCHSCReen:STATe {0|1|OFF|ON}  
TOUCHSCReen:STATe?

**Related Commands** [LOCK](#)

**Arguments** 1 enables the touch screen.  
0 disables the touch screen.  
ON enables the touch screen.  
OFF disables the touch screen.

**Examples** TOUCHSCReen:STATe OFF disables the touch screen.  
TOUCHSCReen:STATe? might return :TOUCHSCREEN:STATE 1 indicating the touch screen is enabled.

## \*TRG (No Query Form)

Performs a group execute trigger on commands defined by \*DDT.

**Group** Miscellaneous

**Syntax** \*TRG

**Related Commands** [\\*DDT](#)

**Examples** \*TRG immediately executes all commands that have been defined by \*DDT.

## TRIGger

This command forces a trigger event to occur. The query returns the current trigger parameters for the instrument.

**Group** Trigger

**Syntax** TRIGger FORCE  
TRIGger?

**Arguments** FORCE creates a trigger event. If TRIGger:STATE is set to READy, the acquisition will complete. Otherwise, this command will be ignored. This is equivalent to pressing the Force button on the front panel.

**Examples** TRIGGER FORCE forces a trigger event to occur.  
TRIGGER? returns the current trigger parameters for the instrument.

## TRIGger:{A|B|B:RESET}

This command sets the A, B, or B Reset trigger level automatically to 50% of the range of the minimum and maximum values of the trigger input signal. The query returns current trigger parameters. The trigger level is the voltage threshold through which the trigger source signal must pass to generate a trigger event. This command is equivalent to pushing the LEVEL knob on the front panel.

**Group** Trigger

**Syntax** TRIGger:{A|B|B:RESET} SETLevel  
TRIGger:{A|B|B:RESET}?

**Arguments** SETLevel sets the trigger level to 50% of the range of the minimum and maximum values of the trigger input signal.

**Examples** TRIGger:A SETLEVEL sets the trigger level to 50% of the range of the minimum and maximum values of the trigger input signal.  
TRIGger:A? returns current trigger parameters.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:CONDition

This command specifies a field or condition for an ARINC429 bus to trigger on. The bus number is specified by x.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:CONDition  
 {SOW|LABe1|DATA|LABELANDDATA |EOW|ERRor}  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:CONDition?

**Arguments** SOW specifies triggering on the first bit of a word.  
 LABe1 specifies triggering on a matching label.  
 DATA specifies triggering on matching packet data field(s).  
 LABELANDDATA specifies triggering on a matching label and matching packet data field(s).  
 EOW specifies triggering on the 32nd bit of a word.  
 ERRor specifies triggering on a specified error condition.

---

**NOTE.** The type of error triggered on is specified by  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:ERRTYPE.

---

**Examples** TRIGGER:A:BUS:B1:ARINC429A:CONDITION DATA specifies triggering on packets that contain matching data field(s).

TRIGGER:A:BUS:B1:ARINC429A:CONDITION? might return SOW, indicating that the bus is triggering on the first bit of each word in the packt.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:DATA:HIVALue

This command sets or queries the high value when trigger on an ARINC429 data field. The bus number is specified by x. The trigger condition must be set to DATA or LABELANDDATA, and the data qualifier must be INrange or OUTrange.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

|                  |                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                   |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:ARINC429A:DATA:HIVALue <QString><br>TRIGger:{A B}:BUS:B<x>:ARINC429A:DATA:HIVALue? |
| <b>Arguments</b> | <QString> is the label value.                                                                             |

---

**NOTE.** The size of the QString is dependent on the data field format selected using BUS:Bx:ARINC429A:DATAFORMAT. Also, the stored QString is reset to its default value whenever the data field format is changed.

---

|                 |                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | TRIGGER:A:BUS:B1:ARINC429A:DATA:HIVALUE<br>"XXXXXXXXXXXXXXXXX1000" sets the value to XXXXXXXXXXXXXXXXXXXX1000.<br><br>TRIGGER:A:BUS:B1:ARINC429A:DATA:HIVALUE? might return<br>"XXXXXXXXXXXXXXXXXXXX", indicating that the value is<br>XXXXXXXXXXXXXXXXXXXX. |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:DATA:QUALifier

This command sets or queries the qualifier to be used when triggering on data in the DATA field for an ARINC429 bus signal. The bus number is specified by x. The trigger condition must be set to DATA or LABELANDDATA.

---

**NOTE.** The trigger qualifier only applies to the bits defined as the data field via the bus data field format specifier (using BUS:B<x>:ARINC429A:DATAFORMAT)

---

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application. |
|-------------------|------------------------------------------------------------------------------|

|                  |                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                            |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:ARINC429A:DATA:<br>QUALifier {Equal UNEQual LESSthan MORethan<br> LESSEQual MOREEQual INrange OUTrange}<br>TRIGger:{A B}:BUS:B<x>:ARINC429A:DATA:QUALifier? |
| <b>Arguments</b> | Equal sets the data qualifier to equal.<br><br>UNEQual sets the data qualifier to unequal.                                                                                         |

LESSThan sets the data qualifier to less than.

MOREthan sets the data qualifier to more than.

LESSEQUAL sets the data qualifier to less equal.

MOREEQUAL sets the data qualifier to more equal.

INrange sets the data qualifier to in range.

OUTrange sets the data qualifier to out of range.

**Examples** TRIGGER:A:BUS:B1:ARINC429A:DATA:QUALIFIER LESSTHAN sets the data qualifier to less than.  
TRIGGER:A:BUS:B1:ARINC429A:DATA:QUALIFIER? might return EQUAL, indicating that the data qualifier is set to equal.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:DATA:VALue

This command sets or queries the low value when triggering on an ARINC429 data field. The bus number is specified by x. The trigger condition must be set to DATA or LABELANDDATA.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:DATA:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:ARINC429A:DATA:VALue?

**Arguments** <QString> is the label value.

---

**NOTE.** The size of the QString is dependent on the data field format selected using BUS:B<x>:ARINC429A:DATAFORMAT. Also, the stored QString is reset to its default value whenever the data field format is changed.

---

**Examples** TRIGGER:A:BUS:B1:ARINC429A:DATA:VALUE "XXXXXXXXXXXXXXXXX1000" sets the value to XXXXXXXXXXXXXXXXXXXX1000.  
TRIGGER:A:BUS:B1:ARINC429A:DATA:VALUE? might return "XXXXXXXXXXXXXXXXXXXX", indicating that the value is XXXXXXXXXXXXXXXXXXXX.

**TRIGger:{A|B}:BUS:B<x>:ARINC429A:ERRTYPe**

This command sets or queries the error type when triggering on an ARINC429 bus signal. The bus number is specified by x. The trigger condition must be set to ERRor.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:ERRTYPe  
{ANY|PARity|WORD|GAP}  
TRIGger:{A|B}:BUS:B<x>:ARINC429A:ERRTYPe?

**Arguments** ANY sets the error type to match any of the other available error types.

PARity sets the error type to match on parity errors (parity value results in even parity count for a word).

WORD sets the error type to match on word errors (any unframed or unknown decode data).

GAP sets the error type to match on gap violations (less than 4 bits idle time between two packets on the bus).

**Examples** TRIGGER:A:BUS:B1:ARINC429A:ERRTYPe PARITY sets the error type to match on parity errors.

TRIGGER:A:BUS:B1:ARINC429A:ERRTYPe? might return ANY, indicating that any error condition will produce a match.

**TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:HIVALue**

This command sets or queries the high value when triggering on an ARINC429 label field. The bus number is specified by x. The trigger condition must be set to LABel, and the label qualifier must be INrange or OUTrange.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:HIVALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:HIVALue?

**Arguments** <QString> is the label value.

**Examples** TRIGGER:A:BUS:B1:ARINC429A:LABEL:HIVALUE "XXXX1010" sets the value to XXXX1010.

TRIGGER:A:BUS:B1:ARINC429A:LABEL:HIVALUE? might return "XXXXXXXX", indicating that the value is XXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:QUALifier

This command sets or queries the qualifier to be used when triggering on label data for an ARINC429 bus signal. The bus number is specified by x. The trigger condition must be set to LABEL or LABELANDDATA.

---

**NOTE.** *If the trigger condition is set to LABELANDDATA, the label qualifier will be locked to Equal until the trigger condition is changed again.*

---

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:  
 QUALifier {Equal|UNEQual|LESSthan|MORethan  
 |LESSEQual|MORREEQual|INrange|OUTrange}  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:QUALifier?

**Arguments** Equal sets the data qualifier to equal.  
 UNEQual sets the data qualifier to unequal.  
 LESSthan sets the data qualifier to less than.  
 MORethan sets the data qualifier to more than.  
 LESSEQual sets the data qualifier to less equal.  
 MORREEQual sets the data qualifier to more equal.  
 INrange sets the data qualifier to in range.  
 OUTrange sets the data qualifier to out of range.

- Examples** TRIGGER:A:BUS:B1:ARINC429A:LABEL:QUALIFIER LESSTHAN sets the label qualifier to less than.
- TRIGGER:A:BUS:B1:ARINC429A:LABEL:QUALIFIER? might return EQUAL, indicating that the label qualifier is set to equal.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:VALue

This command sets or queries the low value when triggering on an ARINC429 label field. The bus number is specified by x. The trigger condition must be set to LABEL or LABELANDDATA.

- Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:ARINC429A:LABel:VALue?

**Arguments** <QString> is the label value.

- Examples** TRIGGER:A:BUS:B1:ARINC429A:LABEL:VALUE "XXXX1010" sets the value to XXXX1010.
- TRIGGER:A:BUS:B1:ARINC429A:LABEL:VALUE? might return "XXXXXXXX", indicating that the value is XXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:SDI:VALue

This command sets or queries the label when triggering on an ARINC429 SDI field. The bus number is specified by x. The trigger condition must be set to DATA or LABELANDDATA, and the data format must be set to DATA.

- Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:SDI:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:SDI:VALue?

**Arguments** <QString> is the label value.

**Examples** TRIGGER:A:BUS:B1:ARINC429A:SDI:VALUE "X0" sets the value to X0.  
 TRIGGER:A:BUS:B1:ARINC429A:SDI:VALUE? might return "XX", indicating that the value is XX.

## TRIGger:{A|B}:BUS:B<x>:ARINC429A:SSM:VALue

This command sets or queries the label value when triggering on an ARINC429 SSM field. The bus number is specified by x. The trigger condition must be set to DATA or LABELANDDATA, and the data format must be set to DATA or SDIDATA.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ARINC429A:SSM:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ARINC429A:SSM:VALue?

**Arguments** <QString> is the label value.

---

**NOTE.** The SSM field is only present when the selected data field format is DATA or SDIDATA (using *BUS:B<x>:ARINC429A:DATAFormat*). Also, the stored QString is reset to its default value whenever the data field format is changed.

---

**Examples** TRIGGER:A:BUS:B1:ARINC429A:SSM:VALUE "X0" sets the value to X0.  
 TRIGGER:A:BUS:B1:ARINC429A:SSM:VALUE? might return "XX", indicating that the value is XX.

## TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition

This command sets the condition (word select, start of frame, or matching data) to be used when triggering on an audio bus signal. The bus number is specified by x.

|                   |                                                                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.                                                                                                                               |
| <b>Group</b>      | Trigger                                                                                                                                                                                                      |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:AUDio:CONDition {SOF DATA}<br>TRIGger:{A B}:BUS:B<x>:AUDio:CONDition?                                                                                                                 |
| <b>Arguments</b>  | SOF enables triggering on a word select or start of frame (depending on Audio Type).<br><br>DATA enables triggering on matching data.                                                                        |
| <b>Examples</b>   | TRIGger:A:BUS:B1:AUDio:CONDition SOF sets the condition to start of frame.<br><br>TRIGger:A:BUS:B1:AUDio:CONDition? might return<br>:TRIGGER:A:BUS:B1:AUDIO:CONDITION DATA indicating the condition is data. |

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:HITDMVALue

This command sets or queries the binary data string for the high data word to be used when triggering on an TDM audio bus signal. The trigger condition must be set to DATA using TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition.

|                  |                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                      |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:AUDio:DATA:HITDMVALue <QString><br>TRIGger:{A B}:BUS:B<x>:AUDio:DATA:HITDMVALue?                                                                                                                                      |
| <b>Arguments</b> | <QString> is the binary data string for the high data word to be used when triggering on an TDM audio bus signal.                                                                                                                            |
| <b>Examples</b>  | TRIGger:A:BUS:B1:AUDio:DATA:HITDMVALue "1100" sets the high value to 1100.<br><br>TRIGger:A:BUS:B1:AUDio:DATA:HITDMVALue? might return :TRIGGER:A:BUS:B1:AUDIO:DATA:HITDMVALUE "XXXXXXXXXXXXXXXXXXXX1010" indicating the high value is 1010. |

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:HIVALue

This command sets the upper word value to be used when triggering on an audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition](#).

The bus number is specified by x.

**Conditions** Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:HIVALue?

**Arguments** <QString> is the upper word value to be used when triggering on an audio bus signal.

**Examples** TRIGger:A:BUS:B1:AUDio:DATA:HIVALue "11001101" sets the hi value to XXXXXXXXXXXXXXXXXXXX11001101.

TRIGger:A:BUS:B1:AUDio:DATA:HIVALue? might  
return :TRIGGER:A:BUS:B1:AUDIO:DATA:HIVALUE  
"XXXXXXXXXXXXXXXXXXXXXXXXXXXX" indicating the hi value is set to  
XXXXXXXXXXXXXXXXXXXXXXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:OFFSet

This command sets the data offset value to be used when triggering on an audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition](#).

The bus number is specified by x.

**Conditions** Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:OFFSet <NR1>  
TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:OFFSet?

**Arguments** <NR1> is the data offset value.

**Examples** TRIGger:A:BUS:B1:AUDIO:DATA:OFFSet 2 sets the data offset to 2.  
 TRIGger:A:BUS:B1:AUDIO:DATA:OFFSet? might return  
 :TRIGGER:A:BUS:B1:AUDIO:DATA:OFFSET 1 indicating the data offset value  
 is 1.

## TRIGger:{A|B}:BUS:B<x>:AUDIO:DATA:QUALifier

This command sets the qualifier to be used when triggering on an audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B<x>:AUDIO:CONDition](#).

The bus number is specified by x.

**Conditions** Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:AUDIO:DATA:QUALifier {LESSthan|MOREthan|EQUAL|UNEQUAL|LESSEQUAL|MOREEQUAL|INrange|OUTrange}  
 TRIGger:{A|B}:BUS:B<x>:AUDIO:DATA:QUALifier?

**Arguments** LESSthan sets the qualifier to less than.  
 MOREthan sets the qualifier to greater than.  
 EQUAL sets the qualifier to equal.  
 UNEQUAL sets the qualifier to not equal.  
 LESSEQUAL sets the qualifier to less than or equal.  
 MOREEQUAL sets the qualifier to greater than or equal.  
 INrange sets the qualifier to in range.  
 OUTrange sets the qualifier to out of range.

**Examples** TRIGger:A:BUS:B1:AUDIO:DATA:QUALifier LESSTHAN sets the qualifier to less than.  
 TRIGger:A:BUS:B1:AUDIO:DATA:QUALifier? might return  
 :TRIGGER:A:BUS:B1:AUDIO:DATA:QUALIFIER EQUAL indicating the  
 qualifies is set to equal.

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:TDMVALue

This command sets or queries the binary data string for the single or low data word to be used when triggering on an TDM audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B{x}:AUDio:CONDition](#).

|                  |                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                   |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:AUDio:DATA:TDMVALue <QString><br>TRIGger:{A B}:BUS:B<x>:AUDio:DATA:TDMVALue?                                                                                                                                       |
| <b>Arguments</b> | <QString> is the binary data string for the single or low data word to be used when triggering on an TDM audio bus signal.                                                                                                                |
| <b>Examples</b>  | TRIGger:A:BUS:B1:AUDio:DATA:TDMVALue "1100" sets the TDMVALUE to 1100.<br><br>TRIGger:A:BUS:B1:AUDio:DATA:TDMVALue? might<br>return :TRIGGER:A:BUS:B1:AUDIO:DATA:TDMVALUE<br>"XXXXXXXXXXXXXXXXXXXX1010" indicating the TDM value is 1010. |

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:VALue

This command sets the lower word value to be used when triggering on an audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition](#).

The bus number is specified by x.

|                   |                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.                |
| <b>Group</b>      | Trigger                                                                                       |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:AUDio:DATA:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:AUDio:DATA:VALue? |
| <b>Arguments</b>  | <QString> specifies the trigger data lower word.                                              |

**Examples** TRIGger:A:BUS:B1:AUDio:DATA:VALue "11001100101" sets the data value to XXXXXXXXXXXXXXXX11001100101.

TRIGger:A:BUS:B1:AUDio:DATA:VALue? might return :TRIGGER:A:BUS:B1:AUDIO:DATA:VALUE "XXXXXXXXXXXXXXXXXXXXXXXXXXXX" indicating the data value is XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:WORD

This command sets the alignment of the data (left, right or either) to be used to trigger on an audio bus signal. The trigger condition must be set to DATA using [TRIGger:{A|B}:BUS:B<x>:AUDio:CONDition](#).

The bus number is specified by x.

- Conditions** Requires option 5-SRAUDIO or SUP5-SRAUDIO Triggering and Analysis application.
- Group** Trigger
- Syntax** TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:WORD {EITHer|LEFt|RIGHt}  
TRIGger:{A|B}:BUS:B<x>:AUDio:DATA:WORD?
- Arguments** EITHer aligns the trigger data to either left or right.  
LEFt aligns the trigger data to the left.  
RIGHt aligns the trigger data to the right.
- Examples** TRIGger:A:BUS:B1:AUDio:DATA:WORD LEFt sets the word alignment to the left.
- TRIGger:A:BUS:B1:AUDio:DATA:WORD? might return :TRIGGER:A:BUS:B1:AUDIO:DATA:WORD EITHer indicating the trigger data is aligned to either left or right.

## TRIGger:{A|B}:BUS:B<x>:AUTOETHERnet:CONDition

This command specifies a field or condition for an Auto Ethernet bus to trigger on when speed is selected as 10 Base-T1S.

- Conditions** Requires option SR-AUTOEN1.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:AUTOETHERnet:CONDition {SYNC  SOSD  PREAmbLe  BEACon  ESD  ESDOK  ERRors} TRIGger:{A B}:BUS:B&lt;x&gt;:AUTOETHERnet:CONDition?</pre>                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Arguments</b> | <p>SYNC specifies the condition for trigger to Sync/Commit symbol.</p> <p>SOSD specifies the condition for trigger to Start of Stream Delimiter symbol.</p> <p>PREAmbLe specifies the condition for trigger to Preamble.</p> <p>BEACon specifies the condition for trigger to Beacon symbol.</p> <p>ESD specifies the condition for trigger to End of Stream Delimiter symbol.</p> <p>ESDOK specifies the condition for trigger to End of Stream Delimiter OK symbol.</p> <p>ERRors specifies the condition for trigger to Errors.</p> |
| <b>Examples</b>  | <pre>TRIGger:A:BUS:B1:AUTOETHERnet:CONDition SYNC sets the field or condition of Auto Ethernet Trigger condition A for Bus 1 as Sync/Commit.</pre> <p>TRIGger:A:BUS:B1:AUTOETHERnet:CONDition? might return<br/>:TRIGger:A:BUS:B1:AUTOETHERnet:CONDition BEACon, indicating that<br/>the field or condition of Auto Ethernet Trigger condition A for Bus 1 is set to<br/>Start of Stream Delimiter.</p>                                                                                                                                |

## TRIGger:{A|B}:BUS:B<x>:AUTOETHERnet:ERRORTYPE

This command specifies the error type for an Auto Ethernet bus to trigger on when speed is selected as 10 Base-T1S. The bus number is specified by x.

|                   |                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SR-AUTOEN1.                                                                                                           |
| <b>Group</b>      | Trigger                                                                                                                               |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:AUTOETHERnet:ERRORTYPE {ESDERR   ESDJAB} TRIGger:{A B}:BUS:B&lt;x&gt;:AUTOETHERnet:ERRORTYPE?</pre> |
| <b>Arguments</b>  | <p>ESDERR specifies the error type for trigger to ESDERR.</p> <p>ESDJAB specifies the error type for trigger to ESDJAB.</p>           |

**Examples** TRIGger:A:BUS:B1:AUTOETHERnet:ERRORTYPE ESDERR sets the error type of Auto Ethernet Trigger condition A for Bus 1 as ESDERR.

TRIGger:A:BUS:B1:AUTOETHERnet:ERRORTYPE? might return :TRIGger:A:BUS:B1:AUTOETHERnet:ERRORTYPE ESDJAB, indicating that the sets the error type of Auto Ethernet Trigger condition A for Bus 1 is set to ESDJAB.

## TRIGger:{A|B}:BUS:B<x>:CAN:CONDition

This command sets the condition (start of frame, frame type, identifier, matching data, EOF, missing ACK field, bit-stuffing error) to be used when triggering on a CAN bus signal. The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:CAN:CONDition  
 {SOF|FRAMEtype|IDentifier|DATA|IDANDDATA|EOF|ERROR|FDBITS}  
 TRIGger:{A|B}:BUS:B<x>:CAN:CONDition?

**Arguments** SOF enables triggering on the start of frame.

FDBITS enables triggering on the values of the BRS and ESI bits in an FD packet.

FRAMEtype enables triggering on the type of frame.

IDentifier enables triggering on a matching identifier.

DATA enables triggering on matching data.

IDANDDATA enables triggering on a matching identifier and matching data.

EOF enables triggering on the end of frame.

ERROR enables triggering on a specified error condition.

**Examples** TRIGGER:A:BUS:B1:CAN:CONDITION? might return :TRIGGER:A:BUS:B1:CAN:CONDITION EOF indicating an end of file condition.

TRIGGER:A:BUS:B1:CAN:CONDITION DATA enables triggering on matching CAN data.

## TRIGger:{A|B}:BUS:B<x>:CAN:DATA:DIRection

This command sets the data direction (read, write or “nocare”) to be used to search on a CAN bus signal. The trigger condition must be set to IDentifier (using [TRIGger:{A|B}:BUS:B<x>:CAN:CONDition](#)). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:CAN:DATA:DIRection  
{READ|WRITE|NOCARE}  
TRIGger:{A|B}:BUS:B<x>:CAN:DATA:DIRection?

**Arguments** READ sets the CAN data direction to READ.  
WRITE sets the CAN data direction to WRITE.  
NOCARE sets the CAN data direction to either.

**Examples** TRIGGER:A:BUS:B1:CAN:DATA:DIRECTION WRITE sets the CAN data direction to Write.  
TRIGGER:A:BUS:B1:CAN:DATA:DIRECTION? might return  
:TRIGGER:A:BUS:B1:CAN:DATA:DIRECTION NOCARE indicating the data direction can be either read or write.

## TRIGger:{A|B}:BUS:B<x>:CAN:DATA:OFFSet

This command sets or queries the data offset value, in bytes, to use when triggering on the CAN data field. The bus number is specified by x. The trigger condition must be set to DATA or IDANDDATA.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:CAN:DATA:OFFSet <NR1>  
TRIGger:{A|B}:BUS:B<x>:CAN:DATA:OFFSet?

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Arguments</b>        | <p>&lt;NR1&gt; is an integer whose minimum and default values are -1 (don't care), and the maximum is up to 7 (for CAN 2.0) or up to 63 (for ISO CAN FD and Non-ISO CAN FD).</p> <p>The maximum is dependent on the number of bytes being matched and the CAN standard selected. Its value is calculated as [Absolute Maximum] - [Data Match Size]. For CAN 2.0, the absolute maximum is 8 bytes. For ISO CAN FD and Non-ISO CAN FD, the absolute maximum is 64 bytes. The minimum data match size is 1 byte, which produces the ranges listed above. Increasing the data match size above 1 byte will adjust the range of valid data offset values accordingly.</p> |
| <b>Examples</b>         | <p>TRIGGER:A:BUS:B1:CAN:DATA:OFFSET 5 sets the CAN data offset to 5 bytes.</p> <p>TRIGGER:A:BUS:B1:CAN:DATA:OFFSET? might return 7, indicating the CAN data offset is 7 bytes.</p> <p>If the CAN standard is set for CAN 2.0, and the trigger data size is set to 3, the maximum value for the data offset will be 5 (8 - 3 = 5).</p> <p>If the CAN standard is set for ISO CAN FD or Non-ISO CAN FD, and the trigger data size is set to 8, the maximum value for the data offset will be 56 (64 - 8 = 56).</p>                                                                                                                                                     |

## TRIGGER:{A|B}:BUS:B<x>:CAN:DATA:QUALIFIER

This command sets the qualifier (<, >, =, ≠, ≤, ≥) to be used when triggering on a CAN bus signal. The trigger condition must be set to IDANDDATA or DATA (using [TRIGGER:{A|B}:BUS:B<x>:CAN:CONDITION](#)). The bus number is specified by x.

|                   |                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                            |

| <b>Examples</b>  | <p>TRIGGER:A:BUS:B1:CAN:DATA:QUALIFIER LESSTHAN sets the instrument to trigger when the data is less than the qualifier value.</p> <p>TRIGGER:A:BUS:B1:CAN:DATA:QUALIFIER? might return<br/>:TRIGGER:A:BUS:B1:CAN:DATA:QUALIFIER LESSTHAN, indicating that the instrument is set to trigger when the data is less than the qualifier value.</p>                                                                                                                                                                                                                                                                         |

## TRIGger:{A|B}:BUS:B<x>:CAN:DATA:SIZE

This command sets the length of the data string, in bytes, to be used when triggering on a CAN bus signal. The trigger condition must be set to IDANDDATA or DATA (using [TRIGger:{A|B}:BUS:B<x>:CAN:CONDition](#)). The bus number is specified by x.

|                   |                                                                                     |
|-------------------|-------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.        |
| <b>Group</b>      | Trigger                                                                             |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:CAN:DATA:SIZE <NR1><br>TRIGger:{A B}:BUS:B<x>:CAN:DATA:SIZE? |
| <b>Arguments</b>  | <NR1> is the length of the data string in bytes.                                    |

**Examples** TRIGGER:A:BUS:B1:CAN:DATA:SIZE 2 sets the data size to 2 bytes.  
 TRIGGER:A:BUS:B1:CAN:DATA:SIZE? might return  
 :TRIGGER:A:BUS:B1:CAN:DATA:SIZE 1 indicating the data size is set to 1 byte.

## TRIGGER:{A|B}:BUS:B<x>:CAN:DATA:VALUE

This command sets the binary data value to be used when triggering on a CAN bus signal. The trigger condition must be set to IDANDDATA or DATA (using [TRIGGER:{A|B}:BUS:B<x>:CAN:CONDITION](#)). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:BUS:B<x>:CAN:DATA:VALUE <QString>  
 TRIGGER:{A|B}:BUS:B<x>:CAN:DATA:VALUE?

**Arguments** <QString> is the data value in binary format. The only allowed characters in the QString are 0, 1, and X.

**Examples** TRIGGER:A:BUS:B1:CAN:DATA:VALUE "1011" sets the CAN data value to 1011.  
 TRIGGER:A:BUS:B1:CAN:DATA:VALUE? might return  
 :TRIGGER:A:BUS:B1:CAN:DATA:VALUE "XXXXXXXX" indicating the data value is set to XXXXXXXX.

## TRIGGER:{A|B}:BUS:B<x>:CAN:ERRType

This command sets or queries the type of error condition for a CAN bus to triggering on. The bus number is specified by x. The trigger condition must be set to ERROR.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:CAN:ERRTYPE  
 {ACKMISS|BITSTUFFing|FORMERROR|ANYERROR}  
 TRIGger:{A|B}:BUS:B<x>:CAN:ERRTYPE?

**Arguments** ACKMISS specifies triggering on a missing ACK field.  
 BITSTUFFing specifies triggering on a bit stuffing error.  
 FORMERROR specifies triggering on a CAN FD form error. To use this option, the CAN standard must be set to FDISO or FDNONISO.  
 ANYERROR specifies triggering on any error type.

**Examples** TRIGGER:A:BUS:B1:CAN:ERRTYPE ACKMISS specifies triggering on any missing ACK fields.  
 TRIGGER:A:BUS:B1:CAN:ERRTYPE? might return ANYERROR, indicating that the bus is triggering on all error types.

## TRIGger:{A|B}:BUS:B<x>:CAN:FD:BRSBit

This command sets or queries the value of the bit rate switch bit (BRS bit) for a CAN bus to triggering on. The bus number is specified by x. The trigger condition must be set to FDBITS, and the CAN standard must be FDISO or FDNONISO.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:CAN:FD:BRSBit {ONE|ZERO|NOCARE}  
 TRIGger:{A|B}:BUS:B<x>:CAN:FD:BRSBit?

**Arguments** ONE filters CAN FD packets to only match those where the BRS bit has a value of 1 (fast data enabled).  
 ZERO filters CAN FD packets to only match those where the BRS bit has a value of 0 (fast data disabled).  
 NOCARE disables filtering of CAN FD packets on the BRS bit.

**Examples** TRIGGER:A:BUS:B1:CAN:FD:BRSBit ONE specifies filtering CAN FD packets for those where the BRS bit has a value of 1.

TRIGGER:A:BUS:B1:CAN:FD:BRSBIT? might return NOCARE, indicating that CAN FD packets are not being filtered based on the BRS bit value.

## TRIGger:{A|B}:BUS:B<x>:CAN:FD:ESIBit

This command sets or queries the value of the error state indicator bit (ESI bit) for a CAN bus to triggering on. The bus number is specified by x. The trigger condition must be set to FDBITS, and the CAN standard must be FDISO or FDNONISO.

|                   |                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                                                            |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:CAN:FD:ESIBit {ONE ZERO NOCARE}<br>TRIGger:{A B}:BUS:B<x>:CAN:FD:ESIBit?                                                                                                                                                                         |
| <b>Arguments</b>  | ONE filters CAN FD packets to only match those where the ESI bit has a value of 1 (recessive).<br><br>ZERO filters CAN FD packets to only match those where the ESI bit has a value of 0 (dominant).<br><br>NOCARE disables filtering of CAN FD packets on the ESI bit. |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:CAN:FD:ESIBit ONE specifies filtering CAN FD packets for those where the ESI bit has a value of 1.<br><br>TRIGGER:A:BUS:B1:CAN:FD:ESIBIT? might return NOCARE, indicating that CAN FD packets are not being filtered based on the ESI bit value.       |

## TRIGger:{A|B}:BUS:B<x>:CAN:FRAMETYPE

This command sets the frame type (data, remote, error or overload) to be used when triggering on a CAN bus signal. The trigger condition must be set to FRAMETYPE (using [TRIGger:{A|B}:BUS:B<x>:CAN:CONDITION](#)). B<x> is the bus number. The bus number is specified by x.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application. |
|-------------------|------------------------------------------------------------------------------|

|                  |                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                             |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:CAN:FRAMeType {DATA REMOte ERRor OVERLoad} TRIGger:{A B}:BUS:B&lt;x&gt;:CAN:FRAMeType?</pre>                                                                                      |
| <b>Arguments</b> | <p>DATA specifies a data frame type.</p> <p>REMOte specifies a remote frame type.</p> <p>ERRor specifies an error frame type.</p> <p>OVERLoad specifies an overload frame type.</p>                                 |

## TRIGger:{A|B}:BUS:B<x>:CAN:IDentifier:MODE

This command sets the addressing mode (standard or extended format) to be used when triggering on a CAN bus signal. The trigger condition must be set to IDANDDATA or DATA (using [TRIGger:{A|B}:BUS:B<x>:CAN:CONDition](#)). The bus number is specified by x.

|                   |                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                      |
| <b>Group</b>      | Trigger                                                                                                                           |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:CAN:IDentifier:MODE {STandard EXTended} TRIGger:{A B}:BUS:B&lt;x&gt;:CAN:IDentifier:MODE?</pre> |
| <b>Arguments</b>  | <p>STandard specifies the standard addressing mode.</p> <p>EXTended specifies the extended addressing mode.</p>                   |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:CAN:IDentifier:MODE EXTENDED sets the addressing mode to extended.                                               |

TRIGger:A:BUS:B1:CAN:IDentifier:MODE? might return  
:TRIGGER:A:BUS:B1:CAN:IDENTIFIER:MODE STANDARD indicating the  
address mode is standard.

## TRIGger:{A|B}:BUS:B<x>:CAN:IDentifier:VALue

This command sets the binary address value to be used when triggering on a CAN bus signal. The trigger condition must be set to IDANDDATA or DATA (using [TRIGger:{A|B}:BUS:B<x>:CAN:CONDition](#)). The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                          |

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition

This command specifies a field or condition within an Ethernet frame to trigger on. The bus number is specified by x.

|                   |                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                       |
| <b>Group</b>      | Trigger                                                                                            |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:ETHERnet:CONDition<br>{SFD MACADDRESS MACLENGTH IPHeader TCPHeader DATA EOP |

IDLE|FCSError|QTAG}

TRIGGER:{A|B}:BUS:B<x>:ETHERnet:CONDition?

**Related Commands** Most of the other TRIGGER:A:BUS:B<x>:ETHERnet commands are impacted by the setting of this command.

**Arguments**

- SFD — Start of frame delimiter.
- MACADDRESS — MAC addresses field.
- MACLENGTH — MAC length/type field.
- IPHeader — IP header field. This argument is only available when PROTOCOL is set to IPv4.
- TCPHeader — TCP header field. This argument is only available when PROTOCOL is set to IPv4.
- DATA — TCP/IPv4 or MAC protocol client data field. If the protocol is set to OTHER, then DATA refers to the MAC client data.
- EOP — End of Packet field.
- IDLE — Idle field.
- FCSError — Frame Check Sequence Error (CRC) field.
- QTAG — IEEE 802.1Q (VLAN) control information field. In order to use QTAG as a trigger condition, the frame type must be set to QTAG ).

**Examples**

TRIGGER:A:BUS:B1:ETHERnet:CONDition MACADDRESS sets the trigger field to MACADDRESS.

TRIGGER:A:BUS:B1:ETHERnet:CONDition? might return DATA.

## TRIGGER:{A|B}:BUS:B<x>:ETHERnet:DATA:HIVALue

When the Ethernet trigger condition is set to DATA, and the qualifier is set to either INrange or OUTrange, this command specifies the upper data value of the range. (Use the command TRIGGER:{A|B}:BUS:B<x>:ETHERnet:DATA:VALue to specify the lower limit of the range.) The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

|                         |                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>            | Trigger                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Related Commands</b> | <p><a href="#">TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:DATA:VALue</a></p> <p><a href="#">TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:DATA:SIZE</a></p> <p><a href="#">TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:CONDition</a></p>                                                                                                                                                                |
| <b>Arguments</b>        | <p>&lt;QString&gt; is a quoted string whose length varies depending on the size setting, up to 32 bits. (Use the command <a href="#">TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:DATA:SIZE</a> to specify the size.) The allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.</p> |
| <b>Examples</b>         | <pre>TRIGger:A:BUS:B1:ETHERnet:DATA:HIVALue "XXXXXXXXXXXXXXXXXXXXXXXXXXXX00001000" sets the upper limit of the range to XXXXXXXXXXXXXXXXXXXXXXXXXXXX00001000(when the trigger condition is set to DATA, and the qualifier is set to INrange or OUTrange) .  TRIGger:A:BUS:B1:ETHERnet:DATA:HIVALue? might return "XXXXXXXXXXXXXXXXXXXXXXXXXXXX"</pre>                                   |

## TRIGger: {A|B}:BUS:B<x>:ETHERnet:DATA:OFFSet

When the Ethernet trigger condition is set to DATA, this command specifies where in the data field to look for the data trigger value. It specifies the offset into the data field, in bytes, where the value will be matched. The default is -1 (don't care). The bus number is specified by x.

|                         |                                                                                                                               |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                                                  |
| <b>Group</b>            | Trigger                                                                                                                       |
| <b>Syntax</b>           | <pre>TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:DATA:OFFSet &lt;NR1&gt; TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:DATA:OFFSet?</pre> |
| <b>Related Commands</b> | <a href="#">TRIGger: {A B}:BUS:B&lt;x&gt;:ETHERnet:CONDition</a>                                                              |

### TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:VALue

- Arguments** <NR1> is an integer whose minimum and default values are -1 (don't care) and maximum is 1,499.
- Examples** TRIGger:A:BUS:B1:ETHERnet:DATA:OFFSet 36 sets the data offset to 36 bytes.
- TRIGger:A:BUS:B1:ETHERnet:DATA:OFFSet? might return -1, indicating that the data offset value is the default value, -1, meaning "don't care".

### TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:QUALifier

This command sets or queries the qualifier to be used when triggering on an Ethernet bus signal. The trigger condition must be set to DATA. The bus number is specified by x.

- Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.
- Group** Trigger
- Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:QUALifier {EQUAL|UNEQUAL|LESSThan|MOREthan|LESSEQUAL|MOREEQUAL|INrange|OUTrange}  
 TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:QUALifier?
- Arguments** LESSThan sets the qualifier to less than.  
 MOREthan sets the qualifier to greater than.  
 EQUAL sets the qualifier to equal.  
 UNEQUAL sets the qualifier to not equal.  
 LESSEQUAL sets the qualifier to less than or equal.  
 MOREEQUAL sets the qualifier to greater than or equal.  
 INrange sets the qualifier to in range.  
 OUTrange sets the qualifier to out of range.
- Examples** TRIGger:A:BUS:B1:ETHERnet:DATA:QUALifier LESSTHAN sets the qualifier to less than.

TRIGger:A:BUS:B1:ETHERnet:DATA:QUALifier? might return  
:TRIGGER:A:BUS:B1:ETHERNET:DATA:QUALIFIER EQUAL indicating the  
qualifier is set to equal.

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:SIZE

When the Ethernet trigger condition is set to DATA, this command specifies the number of contiguous TCP/IPV4/MAC client data bytes to trigger on. The bus number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:SIZE <NR1>  
TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:SIZE?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)

**Arguments** <NR1> specifies the number of contiguous TCP/IPV4/MAC client data bytes. The minimum and default values are 1 and maximum is 16, except when the qualifier is set to Inside Range or Outside Range. In these cases, the maximum size is 4.

**Examples** TRIGger:A:BUS:B1:ETHERnet:DATA:SIZE 4 sets the instrument to trigger on 4 contiguous data bytes.

TRIGger:A:BUS:B1:ETHERnet:DATA:SIZE? might return 6, indicating that the instrument is set to trigger on 6 contiguous data bytes.

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:VALue

When the Ethernet trigger condition is set to DATA, and the qualifier is set to LESSthan, MOREthan, EQUAL, UNEQUAL, LESSEQUAL or MOREEQUAL, this command specifies the value to trigger on. When the Ethernet trigger condition is set to DATA, and the qualifier is set to INrange or OUTrange, this command specifies the lower limit of the range. (Use the command [TRIGger:{A|B}:BUS:B<x>:ETHERnet:DATA:HIVALue](#) to set the upper limit of the range.) The default is all X's (don't care). The bus number is specified by x.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                                                                                                                                                                                                                                                                                                                                                   |

| <b>Arguments</b>        | <QString> is a quoted string where the allowable characters are 0, 1, and X. The allowable number of characters depends on the setting for size (using TRIGger:A:BUS:B<x>:ETHERnet:DATA:SIZE). The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.                                                                                                       |
| <b>Examples</b>         | <p>TRIGger:A:BUS:B1:ETHERnet:DATA:VALue "00001000" sets the binary data to trigger on to 00001000, assuming the qualifier is set to LESSthan, MOREthan, EQUAL, UNEQUAL, LESSEQUAL or MOREEQUAL, and DATA:SIZE is set to 1 byte.</p> <p>TRIGger:A:BUS:B1:ETHERnet:DATA:VALue "00001000" sets the lower limit of the range to 00001000, assuming the qualifier is set to INrange or OUTrange, andDATA:SIZE is set to 1 byte.</p> |

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:DESTinationaddr:VALue

When the Ethernet trigger condition is set to IPHeader, this command specifies the value of the 32-bit destination address that is to be used in the trigger (along with the source address and protocol value). The IP destination address is a standard IP address such as 192.168.0.1. The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:DESTinationaddr:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:DESTinationaddr:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:SOUrceaddr:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:PROTOcol:VALue](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGger:A:BUS:B1:ETHERnet:IPHeader:DESTinationaddr:VALue "0001100100100001011010000000001" sets the IP destination address to trigger on to 192.168.0.1.  
 TRIGger:A:BUS:B1:ETHERnet:IPHeader:DESTinationaddr:VALue might return "XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX01".

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:PROTOcol:VALue

When the Ethernet trigger condition is set to IPHeader, this command specifies the value of the 8-bit protocol field that is to be used in the trigger (along with the source and destination addresses). The default is all X's (don't care). The bus number is specified by x.

---

**NOTE.** Commonly used protocol values are 1 (ICMP), 2 (IGMP), 6 (TCP) and 17 (UDP).

---

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:PROTOcol:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:PROTOcol:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)

TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:SOURceaddr:VALue

TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:DESTinationaddr:VALue

**Arguments** <QString> is a quoted string of up to 8 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGGER:A:BUS:B1:ETHERNET:IPHEADER:PROTOCOL:VALUE "01010010" would set the value to be used in the trigger to 01010010.

TRIGger:A:BUS:B1:ETHERnet:IPHeader:PROTOcol:VALue? might return "XXXXXXXX".

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:IPHeader:SOURceaddr:VALue

When the Ethernet trigger condition is set to **IPHeader**, this command specifies the value of the 32-bit source address that is to be used in the trigger (along with the destination address and protocol value). The IP source address is a standard IP address such as 192.168.0.1. The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:SOURceaddr:VALue  
<QString>  
TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:SOURceaddr:VALue?

**Related Commands** TRIGger: {A|B}:BUS:B<x>:ETHERnet:CONDition

TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:DESTinationaddr:VALue

TRIGger: {A|B}:BUS:B<x>:ETHERnet:IPHeader:PROTOcol:VALue

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGger:A:BUS:B1:ETHERnet:IPHeader:SOURceaddr:VALue  
 "00011001001000010111010000000001" sets the IP source address to trigger on to 192.168.0.1.

TRIGger:A:BUS:B1:ETHERnet:IPHeader:SOURceaddr:VALue might return "XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX01".

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:ADDRess:DESTination:VALue

When the Ethernet trigger condition is set to MACADDRESS, this command specifies the 48-bit MAC destination address that is to be used in the trigger (along with the source address value). The default is all X's (don't care). The bus number is specified by x.

---

**NOTE.** MAC Addresses are 48-bit values such as 08:00:11:1E:C9:AE hex.

---

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:ADDRess:DESTination:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:ADDRess:DESTination:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:ADDRess:SOURce:VALue](#)

**Arguments** <QString> is a quoted string of up to 48 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGger:A:BUS:B1:ETHERnet:MAC:ADDRess:DESTination:VALue  
 "xxxxxxxx01010111111100000011110101010101000" would set the MAC destination address to trigger on to XX:35:FC:07:AA:C8 hex.

TRIGger:A:BUS:B1:ETHERnet:MAC:ADDRess:DESTination:VALue? might return "xxxxxxxx01010111111100000011110101010101000".

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:ADDResS:SOUrce:VALue

When the Ethernet trigger condition is set to `MACADDRESS`, this command specifies the 48-bit MAC source address value that is to be used in the trigger (along with the destination address value). The default is all X's (don't care). The bus number is specified by `x`.

---

**NOTE.** *MAC Addresses are 48-bit values such as 08:00:11:1E:C9:AE hex.*

---

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:LENGth:HIVALue

When the Ethernet trigger condition is set to `MACLENGTH`, and the qualifier is set to `INrange` or `OUTrange`, this command specifies the upper data value of the range. (Use the command [TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:LENGth:VALue](#) to specify the lower limit of the range.) The default is all X's (don't care). The bus number is specified by `x`.

|                         |                                                                                                                                                                                                                                                                                                                                 |

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:LENgth:VALue

When the Ethernet trigger condition is set to MACLENgth, and the qualifier is set to LESSthan, MOREthan, EQUAl, UNEQUAl, LESSEQUAl or MOREEQUAl, this command specifies the 16-bit value to trigger on. When the qualifier is set to INrange or OUTrange, this command specifies the lower limit of the range. (Use the command [TRIGger:{A|B}:BUS:B<x>:ETHERnet:MAC:LENgth:HIVALue](#) to set the upper limit of the range.) The default is all X's (don't care). The bus number is specified by x.

| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:ETHERnet:CONDition</a>                                                                                                                                                                            |
| <b>Arguments</b>        | <p>&lt;QString&gt; is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.</p> |
| <b>Examples</b>         | <p>TRIGGER:A:BUS:B1:ETHERNET:QTAG:VALUE<br/> "XXXXXXXXXXXXXXXXXXXX010010001010" would specify to trigger on the Q-Tag value of hexadecimal XXXXX48A.</p>                                                                                   |

TRIGGER:A:BUS:B1:ETHERNET:QTAG:VALUE? might return "xxxxxxxxxxxxxxxxxxxxxxxx010010001010".

**TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:ACKnum:VALue**

When the Ethernet trigger condition is set to TCPHeader, this command specifies the 32-bit acknowledgement number that is to be used in the trigger (along with the destination and source port addresses and the sequence number). The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:ACKnum:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:ACKnum:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:DESTinationport:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SOUrceport:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SEQnum:VALue](#)

**Arguments** <QString> is a quoted string of up to 32 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGger:A:BUS:B1:ETHERnet:TCPHeader:ACKnum:VALue "xxxxxxxxxxxxxxxxxxxxxxxx00001000" sets the acknowledgement number to be used in the trigger to hexadecimal XXXXX08.  
  
TRIGger:A:BUS:B1:ETHERnet:TCPHeader:ACKnum:VALue? might return :TRIGGER:A:BUS:B1:ETHERNET:TCPHEADER:ACKNUM:VALUE "xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx" indicating the value is set to XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:DESTinationport:VALue

When the Ethernet trigger condition is set `TCPHeader`, this command specifies the 16-bit destination port address value that is to be used in the trigger (along with the acknowledgement value, source port address and the sequence number). The default is all X's (don't care). The bus number is specified by `x`.

**Conditions** Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:DESTinationport:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:DESTinationport:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:ACKnum:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SOUrceport:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SEQnum:VALue](#)

**Arguments** <QString> is a quoted string of up to 16 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples** TRIGger:A:BUS:B1:ETHERnet:TCPHeader:DESTinationport:VALue "XXXXXXXX00100010" would set the destination port address value that is to be used in the trigger to hexadecimal XX22.  
 TRIGger:A:BUS:B1:ETHERnet:TCPHeader:DESTinationport:VALue? might return "XXXXXXXXXXXXXXXX".

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SEQnum:VALue

When the Ethernet trigger condition is set to `TCPHeader`, this command specifies the 32-bit sequence number that is to be used in the trigger (along with the destination and source port addresses and the acknowledgement value). The default is all X's (don't care). The bus number is specified by `x`.

|                         |                                                                                                                                                                                                                                                                                            |

## TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SOUrceport:VALue

When the Ethernet trigger condition is set to TCPHeader, this command specifies the 16-bit source port address that is to be used in the trigger (along with the destination port address, the sequence number and the acknowledgement number). The default is all X's (don't care). The bus number is specified by x.

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRENET or SUP5-SRENET Triggering and Analysis application.                                                           |
| <b>Group</b>      | Trigger                                                                                                                                |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:ETHERnet:TCPHeader:SOUrceport:VALue<br><QString><br>TRIGger:{A B}:BUS:B<x>:ETHERnet:TCPHeader:SOUrceport:VALue? |

**Related Commands**    [TRIGger:{A|B}:BUS:B<x>:ETHERnet:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:ACKnum:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:SEQnum:VALue](#)  
[TRIGger:{A|B}:BUS:B<x>:ETHERnet:TCPHeader:DESTinationport:VALue](#)

**Arguments**    <QString> is a quoted string of up to 16 characters where the allowable characters are 0, 1, and X. The bits specified in the quoted string replace the least significant bits, leaving any unspecified upper bits unchanged.

**Examples**    `TRIGger:A:BUS:B1:ETHERnet:TCPHeader:Sourceport:VALue "XXXX000010100110"` would set the source port address that is to be used in the trigger to hexadecimal X0A6.  
`TRIGger:A:BUS:B1:ETHERnet:TCPHeader:Sourceport:VALue?` might return "XXXXX01001010110".

## TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition

This command specifies the condition to use when triggering on a FlexRay bus signal (start of frame, frame type, ID, cycle count, header, data, ID and data, EOF, error). The bus number is specified by x.

**Conditions**    Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group**    Trigger

**Syntax**    `TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition {SOF|FRAMEType|IDentifier|CYCLEcount|HEADER|DATA|IDANDDATA|EOF|ERROR}`

`TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition?`

**Arguments**    SOF sets the trigger condition to start of frame.  
 FRAMEType sets the trigger condition to frame type.  
 IDentifier sets the trigger condition to identifier.  
 CYCLEcount sets the trigger condition to cycle count.  
 HEADER sets the trigger condition to header.

DATA sets the trigger condition to data.

IDANDDATA sets the trigger condition to id and data.

EOF sets the trigger condition to end of frame.

ERROR sets the trigger condition to error.

**Examples** TRIGGER:A:BUS:B1:FLEXRAY:CONDITION FRAMETYPE sets the FlexRay condition to frame type.

TRIGGER:A:BUS:B1:FLEXRAY:CONDITION? might return TRIGGER:A:BUS:B1:FLEXRAY:CONDITION SOF indicating the FlexRay condition is start of frame.

## TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:HIVALue

This command specifies the high value when triggering on a FlexRay bus cycle count field. (Use TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:VALue to set the low value.) The trigger condition must be set to CYCLEcount (using TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:HIVALue?

**Arguments** <QString> is a quoted string that is the cycle count high value.

**Examples** TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:HIVALUE "110010" sets the cycle count high value to 110010.

TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:HIVALUE? might return TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:HIVALUE "XXXXXX" indicating the cycle count high value is don't care.

## TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:QUALifier

This command specifies the qualifier (<, >, =, <=, >=, not =, in range, out of range) to use when triggering on the FlexRay bus cycle count field. The trigger condition must be set to CYCLEcount (using [TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition](#)). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:QUALifier  
{LESSthan|MOREthan|EQua|UNEQua|LESSEQua|MOREEQua|INrange|OUTrange}

TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:QUALifier?

**Arguments** LESSthan sets the cycle count qualifier to less than.  
MOREthan sets the cycle count qualifier to more than.  
EQua sets the cycle count qualifier to equal.  
UNEQua sets the cycle count qualifier to not equal.  
LESSEQua sets the cycle count qualifier to less than or equal.  
MOREEQua sets the cycle count qualifier to greater than or equal.  
INrange sets the cycle count qualifier to in range.  
OUTrange sets the cycle count qualifier to out of range.

**Examples** TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:QUALIFIER LESSTHAN sets the cycle count qualifier to LESSTHAN.

TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:QUALIFIER? might return TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:QUALIFIER EQUAL indicating that the cycle count qualifier is set to EQUAL.

## TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:VALue

This command specifies the low value when triggering on the FlexRay bus cycle count field. (Use [TRIGger:{A|B}:BUS:B<x>:FLEXray:CYCLEcount:HIVALue](#) to set the upper value.) The trigger condition must be set to CYCLEcount (using

`TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition`). The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                                                                          |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                                               |
| <b>Syntax</b>     | <code>TRIGger:{A B}:BUS:B&lt;x&gt;:FLEXray:CYCLEcount:VALue &lt;QString&gt;</code><br><code>TRIGger:{A B}:BUS:B&lt;x&gt;:FLEXray:CYCLEcount:VALue?</code>                                                                                                                                             |
| <b>Arguments</b>  | <QString> is a quoted binary data string that represents the cycle count low value.                                                                                                                                                                                                                   |
| <b>Examples</b>   | <code>TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:VALUE "11001101"</code> sets the cycle count value to 11001101.<br><br><code>TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:VALUE?</code> might return <code>TRIGGER:A:BUS:B1:FLEXRAY:CYCLECOUNT:VALUE "XXXXXX"</code> indicating the cycle count value is don't care. |

## `TRIGger:{A|B}:BUS:B<x>:FLEXray:DATA:HIVALue`

This command specifies the high value when triggering on the FlexRay bus data field. (Use `TRIGger:{A|B}:BUS:B<x>:FLEXray:DATA:VALue` to set the lower value.) The trigger condition needs to be set to ID or IDANDDATA (using `TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition`). The bus number is specified by x.

|                   |                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                      |
| <b>Group</b>      | Trigger                                                                                                                                           |

| <b>Group</b>      | Trigger                                                                                                                                                                                                         |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:FLEXray:FRAMEType<br>{NORMa1 PAYLoad NULL SYNC STARTup}<br><br>TRIGger:{A B}:BUS:B<x>:FLEXray:FRAMEType?                                                                                 |
| <b>Arguments</b>  | NORMa1 specifies the normal frame type.<br>PAYLoad specifies the payload frame type.<br>NULL specifies the null frame type.<br>SYNC specifies the sync frame type.<br>STARTup specifies the startup frame type. |

**Examples** TRIGGER:A:BUS:B1:FLEXRAY:FRAMETYPE PAYLOAD sets the frame type to payload.

TRIGGER:A:BUS:B1:FLEXRAY:FRAMETYPE? might return  
 TRIGGER:A:BUS:B1:FLEXRAY:FRAMETYPE NORMAL indicating the frame type is set to normal.

## TRIGger:{A|B}:BUS:B<x>:FLEXray:HEADER:CRC

This command specifies the CRC portion of the binary header string when triggering on the FlexRay bus signal. The trigger condition needs to be set to HEADer (using TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:FLEXray:HEADER:CRC <Qstring>  
 TRIGger:{A|B}:BUS:B<x>:FLEXray:HEADER:CRC?

**Arguments** <Qstring> is a quoted string that is the CRC portion of the binary header string.

**Examples** TRIGGER:A:BUS:B1:FLEXRAY:HEADER:CRC "11001100101" sets the CRC portion of the binary header string to 11001100101.

TRIGGER:A:BUS:B1:FLEXRAY:HEADER:CRC? might return  
 TRIGGER:A:BUS:B1:FLEXRAY:HEADER:CRC "XXXXXXXXXXXX" indicating the CRC portion of the binary header string is don't care.

## TRIGger:{A|B}:BUS:B<x>:FLEXray:HEADER:CYCLEcount

This command specifies the cycle count portion of the binary header string when triggering on the FlexRay bus header. The trigger condition needs to be set to HEADer (using TRIGger:{A|B}:BUS:B<x>:FLEXray:CONDition). The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

|                  |                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Conditions</b> | Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:CONDition {START STOP REPEATstart ACKMISS ADDRESS DATA ADDRANDDATA} TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:CONDition?</pre>                                                                                                                                                                                                                                                                                  |
| <b>Arguments</b>  | <p>START specifies a search based on start condition.</p> <p>STOP specifies a search based on stop condition.</p> <p>REPEATstart specifies a search based on repeat of start condition.</p> <p>ACKMISS specifies a search based on missing acknowledgement condition.</p> <p>ADDRESS specifies a search based on address.</p> <p>DATA specifies a search based on data.</p> <p>ADDRANDDATA specifies a search based on address and data.</p> |

**Examples** TRIGGER:A:BUS:B1:I2C:CONDITION START specifies start as the I<sup>2</sup>C trigger condition.

TRIGGER:A:BUS:B1:I2C:CONDITION? might return  
:TRIGGER:A:BUS:B1:I2C:CONDITION START indicating the condition is set to the start condition.

## TRIGger:{A|B}:BUS:B<x>:I2C:DATA:DIRection

This command specifies the I<sup>2</sup>C trigger type to be valid on a Read, Write, or Either condition. Read or write is indicated by the R/W bit in the I<sup>2</sup>C protocol. The bus number is specified by x.

**Conditions** Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:I2C:DATA:DIRection  
{READ|WRITE|NOCARE}  
TRIGger:{A|B}:BUS:B<x>:I2C:DATA:DIRection?

**Arguments** READ specifies read as the data direction.  
WRITE specifies write as the data direction.  
NOCARE specifies either as the data direction.

**Examples** TRIGGER:A:BUS:B1:I2C:DATA:DIRECTION WRITE specifies write as the I<sup>2</sup>C data direction.

TRIGGER:A:BUS:B1:I2C:DATA:DIRECTION? might return  
:TRIGGER:A:BUS:B1:I2C:DATA:DIRECTION NOCARE indicating the data direction is either read or write.

## TRIGger:{A|B}:BUS:B<x>:I2C:DATA:SIZE

This command specifies the length of the data string in bytes to be used for an I<sup>2</sup>C trigger if the trigger condition is DATA or ADDRANDDATA. Applies to bus <x>, where the bus number is specified by x.

**Conditions** Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.

|                  |                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                        |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:DATA:SIZE &lt;NR1&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:DATA:SIZE?</pre>                                                                                  |
| <b>Arguments</b> | <NR1> is the length of the data string in bytes.                                                                                                                                               |
| <b>Examples</b>  | <pre>TRIGger:A:BUS:B1:I2C:DATA:SIZE 1 sets the data size to 1 byte. TRIGger:A:BUS:B1:I2C:DATA:SIZE? might return :TRIGGER:A:BUS:B1:I2C:DATA:SIZE 1 indicating the size is set to 1 byte.</pre> |

## TRIGger:{A|B}:BUS:B<x>:I2C:DATA:VALue

This command specifies the binary data string used for I2C triggering if the trigger condition is DATA or ADDRANDDATA. The bus number is specified by x.

|                   |                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SREMBD or SUP5-SREMBD Triggering and Analysis application.                                                                                                                                           |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:DATA:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:I2C:DATA:VALue?</pre>                                                                                                    |
| <b>Arguments</b>  | <QString> is the binary data string, where the number of bits is 8 times the number of bytes specified. The only allowed characters in the string are 0, 1, and X.                                                     |
| <b>Examples</b>   | <pre>TRIGger:A:BUS:B1:I2C:DATA:VALue "11001101" sets the data value to 1100101. TRIGger:A:BUS:B1:I2C:DATA:VALue? might return :TRIGGER:A:BUS:B1:I2C:DATA:VALUE "XXXXXXXX" indicating the data value is XXXXXXXX.</pre> |

## TRIGger:{A|B}:BUS:B<x>:I3C:ADDRess:MODE

This command specifies the I3C address mode to either 7bit or 10bit when triggering on address field. The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRI3C.                                                                                                                                                                                                                                                                             |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:I3C:ADDRess:MODE {ADDR7 ADDR10}<br>TRIGger:{A B}:BUS:B<x>:I3C:ADDRess:MODE?                                                                                                                                                                                                 |
| <b>Arguments</b>  | ADDR7 sets the trigger condition to 7-bit Address. This is the default value.<br>ADDR10 sets the trigger condition to 10-bit Address.                                                                                                                                                              |
| <b>Examples</b>   | TRIGger:A:BUS:B1:I3C:ADDRess:MODE ADDR10 specifies the trigger to happen on 10-bit Address.<br><br>TRIGger:A:BUS:B1:I3C:ADDRess:MODE? might return<br>:TRIGger:A:BUS:B1:I3C:ADDRess:MODE ADDR10, indicating that 10-bit Address is the currently specified field within a I3C frame to trigger on. |

## TRIGger:{A|B}:BUS:B<x>:I3C:ADDRess:VALue

This command specifies the binary address string used for the I3C trigger if the trigger condition is ADDRESS. The bus number is specified by x.

|                   |                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRI3C.                                                                                                                                     |
| <b>Group</b>      | Trigger                                                                                                                                                    |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:I3C:ADDRess:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:I3C:ADDRess:VALue?                                                            |
| <b>Arguments</b>  | <QString> is a quoted string that is the I3C trigger data value. XXXXXXXX in case of 7-bit addressing mode XXXXXXXXXXXX in case of 10-bit addressing mode. |

**Examples**    `TRIGger:A:BUS:B1:I3C:ADDRESS:VALUE "0101101"` sets the address value as 0101101.

`TRIGger:A:BUS:B1:I3C:ADDRESS:VALUE?` might return `:TRIGger:A:BUS:B1:I3C:ADDRESS:VALUE "0101101110"`, indicating that the address value is 0101101110.

## TRIGger:{A|B}:BUS:B<x>:I3C:CONDition

This command sets or queries the trigger condition for a I3C bus to trigger on. The bus number is specified by x.

**Conditions**    Requires option SRI3C.

**Group**        Trigger

**Syntax**        `TRIGger:{A|B}:BUS:B<x>:I3C:CONDition {START| REPEATStart| ADDRESS| DATA| SDRDirect| SDRBroadcast| ERRors| HOTJoin| HDRRestart| HDRExit| STOP}`  
`TRIGger:{A|B}:BUS:B<x>:I3C:CONDition?`

**Arguments**    `START` sets the trigger condition to `START`. This is the default value.

`REPEATStart` sets the trigger condition to `REPEATStart`.

`ADDRESS` sets the trigger condition to `ADDRESS`.

`DATA` sets the trigger condition to `DATA`.

`SDRDirect` sets the trigger condition to `SDRDirect`.

`SDRBroadcast` sets the trigger condition to `SDRBroadcast`.

`ERRors` sets the trigger condition to `ERRors`.

`HOTJoin` sets the trigger condition to `HOTJoin`.

`HDRRestart` sets the trigger condition to `HDRRestart`.

`HDRExit` sets the trigger condition to `HDRExit`.

`STOP` sets the trigger condition to `STOP`.

**Examples**        `TRIGger:A:BUS:B1:I3C:CONDition START` specifies start as the field within a I3C frame to trigger on.

`TRIGger:A:BUS:B1:I3C:CONDition?` might return  
`:TRIGger:A:BUS:B1:I3C:CONDition START`, indicating that start  
is the currently specified field within a I3C frame to trigger on.

## **TRIGger:{A|B}:BUS:B<x>:I3C:DATA:DIRection**

This command specifies the I3C bus data direction when triggering on data field.  
The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRI3C.                                                                                                                                                                                                                                                                                                                                                         |

| <b>Syntax</b>     | <code>TRIGger:{A B}:BUS:B&lt;x&gt;:I3C:DATA:DIRection</code><br><code>{READ WRITE NOCARE}</code><br><code>TRIGger:{A B}:BUS:B&lt;x&gt;:I3C:DATA:DIRection?</code>                                                                                                                                                                                                              |
| <b>Arguments</b>  | <code>READ</code> sets the trigger condition to Read Packet. This is the default value.<br><code>WRITE</code> sets the trigger condition to Write Packet.<br><code>NOCARE</code> sets the trigger condition to Either Read or Write Packet.                                                                                                                                    |
| <b>Examples</b>   | <code>TRIGger:A:BUS:B1:I3C:DATA:DIRection READ</code> specifies the trigger to<br>happen on 7-bit Address in Read Packets.<br><code>TRIGger:A:BUS:B1:I3C:DATA:DIRection?</code> might return<br><code>:TRIGger:A:BUS:B1:I3C:DATA:DIRection READ</code> , indicating that 7-bit<br>Address in Read packet is the currently specified field within a I3C frame to<br>trigger on. |

## **TRIGger:{A|B}:BUS:B<x>:I3C:DATA:SIZE**

This command specifies the length of the data string in bytes to be used for an I3C  
trigger if the trigger condition is DATA. The bus number is specified by x.

|                   |                        |
|-------------------|------------------------|
| <b>Conditions</b> | Requires option SRI3C. |
| <b>Group</b>      | Trigger                |

|                  |                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:I3C:DATA:SIZE <NR1><br>TRIGger:{A B}:BUS:B<x>:I3C:DATA:SIZE?                                                                                                                    |
| <b>Arguments</b> | <NR1> is the size of the data string in bytes. Data bytes can vary from 1 to 5.                                                                                                                        |
| <b>Examples</b>  | TRIGger:A:BUS:B1:I3C:DATA:SIZE 2 sets the data size value as 2.<br><br>TRIGger:A:BUS:B1:I3C:DATA:SIZE? might return<br>:TRIGger:A:BUS:B1:I3C:DATA:SIZE 2, indicating that the data<br>size value is 2. |

## TRIGger:{A|B}:BUS:B<x>:I3C:DATA:VALue

This command specifies the binary data string used for I3C triggering if the trigger condition is DATA. The bus number is specified by x.

|                   |                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option SRI3C.                                                                                                                                                                                                      |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                     |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:I3C:DATA:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:I3C:DATA:VALue?                                                                                                                                   |
| <b>Arguments</b>  | <QString> is a quoted string that is the I3C trigger data value. Default Data is XXXXXXXXX and user can enter up to XXXXXXXXX XXXXXXXXX XXXXXXXXX XXXXXXXXX XXXXXXXXX.                                                      |
| <b>Examples</b>   | TRIGger:A:BUS:B1:I3C:DATA:VALue "0101101" sets the data value as 0101101.<br><br>TRIGger:A:BUS:B1:I3C:DATA:VALue? might return<br>:TRIGger:A:BUS:B1:I3C:DATA:VALue "0101101", indicating<br>that the data value is 0101101. |

## TRIGger:{A|B}:BUS:B<x>:I3C:ERRORTYPE

This command specifies the error type when triggering on I3C errors. The bus number is specified by x.

|                   |                        |
|-------------------|------------------------|
| <b>Conditions</b> | Requires option SRI3C. |

| <b>Arguments</b>  | ENSLave sets the trigger condition to Enable Slave. This is the default value.<br>DISLave sets the trigger condition to Disable Slave.<br>ENTAsx sets the trigger condition to Enter Activity State.<br>RSTDya sets the trigger condition to Reset Dynamic Address.<br>ENRDya sets the trigger condition to Enter Dynamic Address.<br>SETMwr1 sets the trigger condition to Set Max Write Length.<br>SETMrd1 sets the trigger condition to Set Max Read Length. |

DLSlave sets the trigger condition to Define List of Slaves.  
 ENTRTSTMode sets the trigger condition to Enter Test Mode.  
 EXTime sets the trigger condition to Set Exchange Time.  
 SETaasa sets the trigger condition to Set Static As Dynamic Address.  
 ENDXFER sets the trigger condition to Data Transfer Ending Procedure Control.  
 SETGRPa sets the trigger condition to Set Group Address.  
 RSTACT sets the trigger condition to Slave Reset Action.  
 DEFGRPa sets the trigger condition to Define List of Group Addresses.  
 RSTGRPa sets the trigger condition to Reset Group Address.  
 MLANE sets the trigger condition to Multi-Lane Data Transfer Control.  
 SETBUSCON sets the trigger condition to Set Bus Context.

**Examples** TRIGger:A:BUS:B1:I3C:SDR:BROADCASTPacket SETMwr1 specifies Set Max Write Length as the field within a I3C frame to trigger on.  
 TRIGger:A:BUS:B1:I3C:SDR:BROADCASTPacket? might return :TRIGger:A:BUS:B1:I3C:SDR:BROADCASTPacket SETMwr1, indicating that Set Max Write Length is the currently specified field within a I3C frame to trigger on.

## TRIGger:{A|B}:BUS:B<x>:I3C:SDR:DIRECTPacket

This command sets or queries the I3C trigger for SDR Direct Packets. The bus number is specified by x.

**Conditions** Requires option SRI3C.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:I3C:SDR:DIRECTPacket {ENSLave| DISLave| ENTAsx| RSTDya| SETMwr1| SETMRd1| SETExt| SETDya| SETNdya| GETMwr1| GETMRd1| GETPrId| GETBusch| GETDevch| GETSlave| ACCM| SETBrt| MDATASpeed| HDRCapability| GETXTime| GETCAPS| ENDXFER| SETGRPa| RSTACT| DEFGRPa| RSTGRPa| MLANE}  
 TRIGger:{A|B}:BUS:B<x>:I3C:SDR:DIRECTPacket?

**Arguments** ENSLave sets the trigger condition to Enable Slave. This is the default value.  
 DISLave sets the trigger condition to Disable Slave.

ENTAsx sets the trigger condition to Enter Activity State.

RSTDya sets the trigger condition to Reset Dynamic Address.

SETMwr1 sets the trigger condition to Set Max Write Length.

SETMRd1 sets the trigger condition to Set Max Read Length.

SETExt sets the trigger condition to Set Exchange Time.

SETDya sets the trigger condition to Set Dynamic Address.

SETNdya sets the trigger condition to Set New Dynamic Address.

GETMwr1 sets the trigger condition to Get Max Write Length.

GETMRd1 sets the trigger condition to Get Max Read Length.

GETPrId sets the trigger condition to Get Provisional ID.

GETBUSch sets the trigger condition to Get Bus Characteristics.

GETDevch sets the trigger condition to Get Dev Characteristics.

GETSlave sets the trigger condition to Get Slave Current Status.

ACCM sets the trigger condition to Get Accept Mastership.

SETBrt sets the trigger condition to Set Bridge Direct Target.

MDATASpeed sets the trigger condition to Get Max Data Speed.

HDRCapability sets the trigger condition to Get HDR Capability.

GETXTIME sets the trigger condition to Get Exchange Time.

GETCAPS sets the trigger condition to Get Optional Feature Capabilities.

ENDXFER sets the trigger condition to Data Transfer Ending Procedure Control.

SETGRPa sets the trigger condition to Set Group Address.

RSTACT sets the trigger condition to Slave Reset Action.

DEFGRPa sets the trigger condition to Define List of Group Addresses.

RSTGRPa sets the trigger condition to Reset Group Address.

MLANE sets the trigger condition to Multi-Lane Data Transfer Control.

**Examples**

TRIGGER:A:BUS:B1:I3C:SDR:DIRECTPacket RSTDya specifies Reset Dynamic Address as the field within a I3C frame to trigger on.

TRIGGER:A:BUS:B1:I3C:SDR:DIRECTPacket? might return :TRIGGER:A:BUS:B1:I3C:SDR:DIRECTPacket RSTDya, indicating that Reset Dynamic Address is the currently specified field within a I3C frame to trigger on.

## TRIGger:{A|B}:BUS:B<x>:I3C:TBIT:DIREction

This command specifies the I3C trigger for T-Bit error direction when triggering on error type field. The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                  |

| <b>Arguments</b>  | READ sets the trigger condition to T-bit Parity Error. This is the default value.<br>WRITE sets the trigger condition to T-bit Slave Error.                                                                                                                                                                      |
| <b>Examples</b>   | TRIGger:A:BUS:B1:I3C:TBIT:DIREction READ specifies the trigger to happen on T-bit Parity Error.<br><br>TRIGger:A:BUS:B1:I3C:TBIT:DIREction? might return<br>:TRIGger:A:BUS:B1:I3C:TBIT:DIREction READ, indicating that T-bit Parity error is the currently selected error type within a I3C frame to trigger on. |

## TRIGger:{A|B}:BUS:B<x>:LIN:CONDition

This command specifies the trigger condition for LIN. The bus number is specified by x.

|                   |                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                  |
| <b>Group</b>      | Trigger                                                                                                                                       |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:LIN:CONDition<br>{SYNCfield IDENTIFIER DATA IDANDDATA WAKEup SLEEP ERROR}<br><br>TRIGger:{A B}:BUS:B<x>:LIN:CONDition? |
| <b>Arguments</b>  | SYNCfield sets the LIN trigger condition to sync field.<br>IDENTIFIER sets the LIN trigger condition to identifier.                           |

DATA sets the LIN trigger condition to data.

IDANDDATA sets the LIN trigger condition to id and data.

WAKEup sets the LIN trigger condition to wake up.

SLEEP sets the LIN trigger condition to sleep.

ERROR sets the LIN trigger condition to error.

**Examples** TRIGGER:A:BUS:B1:LIN:CONDITION ERROR sets the LIN trigger condition to error.

TRIGGER:A:BUS:B1:LIN:CONDITION? might return  
TRIGGER:A:BUS:B1:LIN:CONDITION SYNCFIELD indicating the LIN trigger condition is sync field.

## TRIGger:{A|B}:BUS:B<x>:LIN:DATA:HIVALue

This command specifies the high data value string used for a LIN bus trigger when the trigger condition is DATA or IDANDDATA and the data qualifier is INRANGE or OTRANGE. The bus number is specified by x.

**Conditions** Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:LIN:DATA:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:LIN:DATA:HIVALue?

**Arguments** <QString> is a quoted string that is the binary data string used for LIN trigger if the trigger condition is ID or IDANDDATA.

**Examples** TRIGGER:A:BUS:B1:LIN:DATA:HIVALUE "11001010" sets the high value to 11001010.

TRIGGER:A:BUS:B1:LIN:DATA:HIVALUE? might return  
TRIGGER:A:BUS:B1:LIN:DATA:HIVALUE "XXXXXXXX" indicating the high value is don't care.

## TRIGger:{A|B}:BUS:B<x>:LIN:DATA:QUALifier

This command specifies the LIN data qualifier. This only applies if the trigger condition is IDANDDATA or DATA. The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Syntax</b>     | <p>TRIGger:{A B}:BUS:B&lt;x&gt;:LIN:DATA:QUALifier<br/>         {LESSthan MOREthan EQUAL UNEQUAL LESSEQUAL MOREEQUAL INrange OUTrange}</p> <p>TRIGger:{A B}:BUS:B&lt;x&gt;:LIN:DATA:QUALifier?</p>                                                                                                                                                                                                                                                                                                 |
| <b>Arguments</b>  | <p>LESSthan sets the LIN data qualifier to less than.</p> <p>MOREthan sets the LIN data qualifier to greater than.</p> <p>EQUAL sets the LIN data qualifier to equal.</p> <p>UNEQUAL sets the LIN data qualifier to not equal.</p> <p>LESSEQUAL sets the LIN data qualifier to less than or equal.</p> <p>MOREEQUAL sets the LIN data qualifier to greater than or equal.</p> <p>INrange sets the LIN data qualifier to in range.</p> <p>OUTrange sets the LIN data qualifier to out of range.</p> |
| <b>Examples</b>   | <p>TRIGGER:A:BUS:B1:LIN:DATA:QUALIFIER OUTRANGE sets the data qualifier to out of range.</p> <p>TRIGGER:A:BUS:B1:LIN:DATA:QUALIFIER? might return<br/>         TRIGGER:A:BUS:B1:LIN:DATA:QUALIFIER EQUAL indicating the data qualifier is set to equal.</p>                                                                                                                                                                                                                                        |

## TRIGger:{A|B}:BUS:B<x>:LIN:DATA:SIZE

This command specifies the length of the data string in bytes to be used for LIN trigger. The bus number is specified by x.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application. |
|-------------------|------------------------------------------------------------------------------|

|                  |                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                 |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:B<x>:LIN:DATA:SIZE <NR1><br>TRIGger:{A B}:BUS:B<x>:LIN:DATA:SIZE?                                                                                                     |
| <b>Arguments</b> | <NR1> is the size of the data string in bytes.                                                                                                                                          |
| <b>Examples</b>  | TRIGGER:A:BUS:B1:LIN:DATA:SIZE 8 sets the data size to 8 bytes.<br>TRIGGER:A:BUS:B1:LIN:DATA:SIZE? might return<br>TRIGGER:A:BUS:B1:LIN:DATA:SIZE 1 indicating the data size is 1 byte. |

## TRIGger:{A|B}:BUS:B<x>:LIN:DATA:VALue

This command specifies the binary data string to be used for LIN trigger condition if trigger condition is ID or IDANDDATA. The bus number is specified by x.

|                   |                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                        |
| <b>Group</b>      | Trigger                                                                                                                                                                                                             |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:LIN:DATA:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:LIN:DATA:VALue?                                                                                                                           |
| <b>Arguments</b>  | <QString> is a quoted string that is the LIN trigger data value.                                                                                                                                                    |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:LIN:DATA:VALUE "11001101" sets the data value to 11001101.<br>TRIGGER:A:BUS:B1:LIN:DATA:VALUE? might return<br>TRIGGER:A:BUS:B1:LIN:DATA:VALUE "XXXXXXXX" indicating the data value is don't care. |

## TRIGger:{A|B}:BUS:B<x>:LIN:ERRTYPE

This command specifies the error type be used for LIN trigger. The bus number is specified by x.

|                   |                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                                                                                                                                     |
| <b>Group</b>      | Trigger                                                                                                                                                                                                          |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:LIN:ERRTYPE {SYNC PARity Checksum}<br>TRIGger:{A B}:BUS:B<x>:LIN:ERRTYPE?                                                                                                                 |
| <b>Arguments</b>  | <p>SYNC sets the LIN error type to SYNC.</p> <p>PARity sets the LIN error type to parity.</p> <p>Checksum sets the LIN error type to checksum.</p>                                                               |
| <b>Examples</b>   | <p>TRIGGER:A:BUS:B1:LIN:ERRTYPE CHECKSUM sets the LIN error type to checksum.</p> <p>TRIGGER:A:BUS:B1:LIN:ERRTYPE? might return<br/>TRIGGER:A:BUS:B1:LIN:ERRTYPE SYNC indicating the LIN error type is SYNC.</p> |

## TRIGger:{A|B}:BUS:B<x>:LIN:IDentifier:VALue

This command specifies the binary address string used for LIN bus trigger if the trigger condition is ID or IDANDDATA. The bus number is specified by x.

|                   |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAUTO or SUP5-SRAUTO Triggering and Analysis application.                             |
| <b>Group</b>      | Trigger                                                                                                  |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:LIN:IDentifier:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:LIN:IDentifier:VALue?    |
| <b>Arguments</b>  | <QString> is the binary address string used for LIN trigger if the trigger condition is ID or IDANDDATA. |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:LIN:IDENTIFIER:VALUE "110010" sets the identifier value to 110010.                      |

TRIGGER:A:BUS:B1:LIN:IDENTIFIER:VALUE? might return  
TRIGGER:A:BUS:B1:LIN:IDENTIFIER:VALUE "XXXXXX" indicating the  
identifier value is XXXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:ADDRESS:HIVALue

This command sets or queries the high value when triggering on command word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to COMMAND, and the address qualifier must be INrange or OUTrange.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:ADDRESS:HIVALue  
<QString>  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:ADDRESS:HIVALue?

**Arguments** <QString> is the address value.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:COMMAND:ADDRESS:HIVALUE "X1000"  
sets the value to X1000.

TRIGGER:A:BUS:B1:MIL1553B:COMMAND:ADDRESS:HIVALUE? might return  
"XXXXXX", indicating that the value is XXXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:ADDRESS:QUALifier

This command sets or queries the qualifier to be used when triggering on command word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:ADDRESS:VALue

This command sets or queries the low value when triggering on command word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to COMMAND

|                   |                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                          |
| <b>Group</b>      | Trigger                                                                                                                                               |
| <b>Syntax</b>     | <pre> TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:COMMAND:ADDRESS:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:COMMAND:ADDRESS:VALue? </pre> |
| <b>Arguments</b>  | <QString> is the address value.                                                                                                                       |

**Examples** TRIGGER:A:BUS:B1:MIL1553B:COMMAND:ADDRESS:VALUE "X1000" sets the value to X1000.

TRIGGER:A:BUS:B1:MIL1553B:COMMAND:ADDRESS:VALUE? might return "XXXXX", indicating that the value is XXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:COUNT

This command sets or queries the value of the command word "word count" field for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:COUNT <QString>  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:COUNT?

**Arguments** <QString> is the word count value.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:COMMAND:COUNT "X1000" sets the value to X1000.

TRIGGER:A:BUS:B1:MIL1553B:COMMAND:COUNT? might return "XXXXX", indicating that the value is XXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:PARity

This command sets or queries the value of the command word parity bit for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

| <b>Arguments</b> | <p>ONE filters command words to only match those where the parity bit has a value of 1.</p> <p>ZERO filters command words to only match those where the parity bit has a value of 0.</p> <p>NOCARE disables filtering of command words on the parity bit.</p>                                    |
| <b>Examples</b>  | <p>TRIGGER:A:BUS:B1:MIL1553B:COMMAND:PARITY ONE specifies filtering command words for those where the parity bit has a value of 1.</p> <p>TRIGGER:A:BUS:B1:MIL1553B:COMMAND:PARITY? might return NOCARE, indicating that command words are not being filtered based on the parity bit value.</p> |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:SUBADdress

This command sets or queries the value of the command word subaddress field for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to COMMAND.

|                   |                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                        |
| <b>Group</b>      | Trigger                                                                                                                                                                                             |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:COMMAND:SUBADdress &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:COMMAND:SUBADdress?</pre>                                                       |
| <b>Arguments</b>  | <QString> is the subaddress value.                                                                                                                                                                  |
| <b>Examples</b>   | <p>TRIGGER:A:BUS:B1:MIL1553B:COMMAND:SUBADDRESS "X1000" sets the value to X1000.</p> <p>TRIGGER:A:BUS:B1:MIL1553B:COMMAND:SUBADDRESS? might return "XXXXX", indicating that the value is XXXXX.</p> |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:TRBit

This command sets or queries the value of the command word Transmit / Receive bit for a MIL-STD-1553 bus to trigger on. The bus number is specified by x. The trigger condition must be set to COMMAND.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:TRBit {RX|TX|X}  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:COMMAND:TRBit?

**Arguments** RX filters command words to only match those that are receive packets.  
TX filters command words to only match those that are transmit packets.  
X disables filtering of command words on the R/T bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:COMMAND:TRBIT TX specifies filtering command words for only transmit messages.  
TRIGGER:A:BUS:B1:MIL1553B:COMMAND:TRBIT? might return X, indicating that command words are not being filtered based on the R/T bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:CONDition

This command sets or queries the field or condition for a MIL-STD-1553 bus to trigger on. The bus number is specified by x.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:CONDition  
{SYNC|COMMAND|STATUS|DATA |TIME|ERROR}  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:CONDition?

**Arguments** SYNC specifies triggering on the sync pulse of any word.  
 COMMAND specifies triggering on a matching command word.  
 STATUs specifies triggering on a matching status word.  
 DATA specifies triggering on a matching data word.  
 TIME specifies triggering on the response time or intermessage gap between words.  
 ERRor specifies triggering on a specified error condition.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:CONDITION DATA specifies finding matching data word(s).  
 TRIGGER:A:BUS:B1:MIL1553B:CONDITION? might return SYNC, indicating that the bus is triggering on sync pulses found in any word.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:DATA:PARity

This command sets or queries the value of the command word parity bit for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to DATA.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:DATA:PARity  
 {ONE|ZERO|NOCARE}  
 TRIGger:{A|B}:BUS:B<x>:MIL1553B:DATA:PARity?

**Arguments** ONE filters data words to only match those where the parity bit has a value of 1.  
 ZERO filters data words to only match those where the parity bit has a value of 0.  
 NOCARE disables filtering of data words on the parity bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:DATA:PARITY ONE specifies filtering data words for those where the parity bit has the value 1.  
 TRIGGER:A:BUS:B1:MIL1553B:DATA:PARITY? might return NOCARE, indicating that data words are not being filtered based on the parity bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:DATA:VALue

This command sets or queries the value when triggering on data words for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to DATA.

|                   |                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                        |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                             |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:MIL1553B:DATA:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:MIL1553B:DATA:VALue?                                                                                                                                 |
| <b>Arguments</b>  | <QString> is the data value.                                                                                                                                                                                                        |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:MIL1553B:DATA:VALUE "XXXXXXXXXXXX1000" sets the value to XXXXXXXXXXXXXXX1000.<br><br>TRIGGER:A:BUS:B1:MIL1553B:DATA:VALUE? might return "XXXXXXXXXXXXXXXXXXXX", indicating that the value is XXXXXXXXXXXXXXXXXXXX. |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:ERRTYPe

This command sets or queries the type of error condition for a MIL-STD-1553 bus to trigger on. The bus number is specified by x. The trigger condition must be set to ERRor.

|                   |                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                         |
| <b>Group</b>      | Trigger                                                                                                                                                                                              |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:MIL1553B:ERRTYPe {PARity SYNC DATA}<br>TRIGger:{A B}:BUS:B<x>:MIL1553B:ERRTYPe?                                                                                               |
| <b>Arguments</b>  | PARity specifies triggering on an incorrectly calculated parity bit in any word.<br><br>SYNC specifies triggering on any sync pulse that does not transition in the middle of the pulse as required. |

DATA specifies triggering on any non-contiguous data words.

- Examples** TRIGGER:A:BUS:B1:MIL1553B:ERRTYPE DATA specifies triggering on non-contiguous data words.
- TRIGGER:A:BUS:B1:MIL1553B:ERRTYPE? might return PARITY, indicating that the bus is triggering on parity errors in any word.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:ADDRess:HIVALue

This command sets or queries the high value when triggering on status word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to STATUS and the address qualifier must be INrange or OUTrange.

- Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.
- Group** Trigger
- Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:ADDRess:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:ADDRess:HIVALue?
- Arguments** <QString> is the address value.
- Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:ADDRESS:HIVALUE "X1000" sets the value to X1000.
- TRIGGER:A:BUS:B1:MIL1553B:STATUS:ADDRESS:HIVALUE? might return "XXXXXX", indicating that the value is XXXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:ADDRess:QUALifier

This command sets or queries the qualifier to be used when triggering on status word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to STATUS.

- Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:ADDRes:VALue

This command sets or queries the low value when triggering on status word addresses for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to STATUS.

|                   |                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                    |
| <b>Group</b>      | Trigger                                                                                                                                         |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:STATus:ADDRes:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:STATus:ADDRes:VALue?</pre> |
| <b>Arguments</b>  | <QString> is the address value.                                                                                                                 |

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:ADDRESS:VALUE "X1000" sets the value to X1000.

TRIGGER:A:BUS:B1:MIL1553B:STATUS:ADDRESS:VALUE? might return "XXXXX", indicating that the value is XXXXX.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:BCR

This command sets or queries the value of the broadcast command received bit (BCR bit, bit 15) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATUS.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:BCR  
{ONE|ZERO|NOCARE}  
TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:BCR?

**Arguments** ONE filters status words to only match those where the BCR bit has a value of 1.  
ZERO filters status words to only match those where the BCR bit has a value of 0.  
NOCARE disables filtering of status words on the BCR bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:BCR ONE specifies filtering status words for those where the BCR bit has a value of 1.

TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:BCR? might return NOCARE, indicating that status words are not being filtered based on the BCR bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:BUSY

This command sets or queries the value of the busy bit (BUSY bit, bit 16) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATUS.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

|                  |                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                      |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:STATUS:BIT:BUSY {ONE ZERO NOCARE} TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:STATUS:BIT:BUSY?</pre>                                                                                                                                                    |
| <b>Arguments</b> | <p>ONE filters status words to only match those where the BUSY bit has a value of 1.</p> <p>ZERO filters status words to only match those where the BUSY bit has a value of 0.</p> <p>NOCARE disables filtering of status words on the BUSY bit.</p>                                         |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:ME

This command sets or queries the value of the message error bit (ME bit, bit 9) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATUS.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application. |
| <b>Group</b>      | Trigger                                                                      |

**Syntax** TRIGGER:{A|B}:BUS:B<x>:MIL1553B:STATUS:BIT:ME  
 {ONE|ZERO|NOCARE}  
 TRIGGER:{A|B}:BUS:B<x>:MIL1553B:STATUS:BIT:ME?

**Arguments** ONE filters status words to only match those where the ME bit has a value of 1.  
 ZERO filters status words to only match those where the ME bit has a value of 0.  
 NOCARE disables filtering of status words on the ME bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:ME ONE specifies filtering status words for those where the ME bit has a value of 1.  
 TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:ME? might return NOCARE, indicating that status words are not being filtered based on the ME bit value.

## TRIGGER:{A|B}:BUS:B<x>:MIL1553B:STATUS:BIT:SRQ

This command sets or queries the value of the status word service request bit (SRQ bit, bit 11) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATUS.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:BUS:B<x>:MIL1553B:STATUS:BIT:SRQ  
 {ONE|ZERO|NOCARE}  
 TRIGGER:{A|B}:BUS:B<x>:MIL1553B:STATUS:BIT:SRQ?

**Arguments** ONE filters status words to only match those where the SRQ bit has a value of 1.  
 ZERO filters status words to only match those where the SRQ bit has a value of 0.  
 NOCARE disables filtering of status words on the SRQ bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:SRQ ONE specifies filtering status words for those where the SRQ bit has a value of 1.  
 TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:SRQ? might return NOCARE, indicating that status words are not being filtered based on the SRQ bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:SUBSF

This command sets or queries the value of the subsystem flag bit (SUBSF bit, bit 17) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATus.

|                   |                                                                                                                                                                                                                                                                                       |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:BIT:TF

This command sets or queries the value of the terminal flag bit (TF bit, bit 19) in a status word for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATus.

|                   |                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                         |
| <b>Group</b>      | Trigger                                                                                                              |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:MIL1553B:STATus:BIT:TF<br>{ONE ZERO NOCARE}<br>TRIGger:{A B}:BUS:B<x>:MIL1553B:STATus:BIT:TF? |

**Arguments** ONE filters status words to only match those where the TF bit has a value of 1.  
 ZERO filters status words to only match those where the TF bit has a value of 0.  
 NOCARE disables filtering of status words on the TF bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:TF ONE specifies filtering status words for those where the TF bit has a value of 1.  
 TRIGGER:A:BUS:B1:MIL1553B:STATUS:BIT:TF? might return NOCARE, indicating that status words are not being filtered based on the TF bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:PARity

This command sets or queries the value of the status word parity bit for a MIL-STD-1553 bus to triggering on. The bus number is specified by x. The trigger condition must be set to STATus.

**Conditions** Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:PARity  
 {ONE|ZERo|NOCARE}  
 TRIGger:{A|B}:BUS:B<x>:MIL1553B:STATus:PARity?

**Arguments** ONE filters status words to only match those where the parity bit has a value of 1.  
 ZERO filters status words to only match those where the parity bit has a value of 0.  
 NOCARE disables filtering of status words on the parity bit.

**Examples** TRIGGER:A:BUS:B1:MIL1553B:STATUS:PARITY ONE specifies filtering status words for those where the parity bit has a value of 1.  
 TRIGGER:A:BUS:B1:MIL1553B:STATUS:PARITY? might return NOCARE, indicating that status words are not being filtered based on the parity bit value.

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:LESSLimit

This command sets or queries the lower limit to be used when triggering on response time / inter message gap time for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to TIME.

|                         |                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                                                                                                                |
| <b>Group</b>            | Trigger                                                                                                                                                                                                                                                     |
| <b>Syntax</b>           | TRIGger:{A B}:BUS:B<x>:MIL1553B:TIME:LESSLimit <NR3><br>TRIGger:{A B}:BUS:B<x>:MIL1553B:TIME:LESSLimit?                                                                                                                                                     |
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:TIME:QUALifier</a>                                                                                                                                                                                        |
| <b>Arguments</b>        | <NR3> is a floating point number that specifies the lower bound for measuring remote terminal response time (RT) or the inter-message gap (IMG) in seconds.                                                                                                 |
| <b>Examples</b>         | TRIGGER:A:BUS:B1:MIL1553B:TIME:LESSLIMIT 2.0000e-6 sets the lower bound for comparison to 2 microseconds.<br><br>TRIGGER:A:BUS:B1:MIL1553B:TIME:LESSLIMIT? might return 4.0000E-6, indicating that the lower bound for comparison is set to 4 microseconds. |

## TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:MORELimit

This command sets or queries the upper limit to be used when triggering on response time / inter message gap time for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to TIME.

|                         |                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.                                                                                |
| <b>Group</b>            | Trigger                                                                                                                                                     |
| <b>Syntax</b>           | TRIGger:{A B}:BUS:B<x>:MIL1553B:TIME:MORELimit <NR3><br>TRIGger:{A B}:BUS:B<x>:MIL1553B:TIME:MORELimit?                                                     |
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:MIL1553B:TIME:QUALifier</a>                                                                                        |
| <b>Arguments</b>        | <NR3> is a floating point number that specifies the upper bound for measuring remote terminal response time (RT) or the inter-message gap (IMG) in seconds. |

- Examples**     `TRIGGER:A:BUS:B1:MIL1553B:TIME:MORELIMIT 15.0000e-6` sets the upper bound for comparison to 15 microseconds.
- `TRIGGER:A:BUS:B1:MIL1553B:TIME:MORELIMIT?` might return `12.0000E-6`, indicating that the upper bound for comparison is set to 12 microseconds.

## **TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:QUALifier**

This command sets or queries the qualifier to be used when triggering on response time / inter message gap time for a MIL-STD-1553 bus. The bus number is specified by x. The trigger condition must be set to TIME.

- Conditions**     Requires option 5-SRAERO or SUP5-SRAERO Triggering and Analysis application.
- Group**             Trigger
- Syntax**            `TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:QUALifier`  
`{LESSthan|MOREthan|INrange|OUTrange}`  
`TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:QUALifier?`
- Related Commands**     [TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:LESSLimit](#)  
[TRIGger:{A|B}:BUS:B<x>:MIL1553B:TIME:MORELimit](#)
- Arguments**        `LESSthan` sets the data qualifier to less than.  
`MOREthan` sets the data qualifier to more than.  
`INrange` sets the data qualifier to in range.  
`OUTrange` sets the data qualifier to out of range.
- Examples**         `TRIGGER:A:BUS:B1:MIL1553B:TIME:QUALIFIER LESSTHAN` sets the time comparison qualifier to less than.
- `TRIGGER:A:BUS:B1:MIL1553B:TIME:QUALIFIER?` might return `OUTRANGE`, indicating that the qualifier is set to out-of-range comparison.

## **TRIGger:{A|B}:BUS:B<x>:PARAllel:DATa:VALue**

This command specifies the binary data string used for a Parallel Bus trigger. The bus number is specified by x.

|                  |                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                   |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:PARAllel:DATA:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:PARAllel:DATA:VALue?</pre>                                                                                             |
| <b>Arguments</b> | <QString> is the binary data string used for a Parallel Bus trigger.                                                                                                                                                      |
| <b>Examples</b>  | <pre>TRIGger:A:BUS:B1:PARAllel:DATA:VALue "11001101" sets the data value to 11001101.  TRIGger:A:BUS:B1:PARAllel:DATA:VALue? might return :TRIGGER:A:BUS:B1:PARALLEL:DATA:VALUE "X" indicating the data value is X.</pre> |

## TRIGger:{A|B}:BUS:B<x>:RS232C:CONDition

This command specifies the condition for an RS-232C trigger, where the bus number is specified by < >x.

|                   |                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.                                                                                                                                                         |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                              |
| <b>Syntax</b>     | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:RS232C:CONDition {START Eop DATA PARItYerror} TRIGger:{A B}:BUS:B&lt;x&gt;:RS232C:CONDition?</pre>                                                                                                 |
| <b>Arguments</b>  | <p>START sets the Trigger on condition to Start.</p> <p>Eop sets the Trigger on condition to End of Packet.</p> <p>DATA sets the Trigger on condition to Data.</p> <p>PARItYerror sets the Trigger on condition to Parity Error.</p> |
| <b>Examples</b>   | <pre>TRIGger:A:BUS:B1:RS232C:CONDition DATA sets the trigger on condition to data.  TRIGger:A:BUS:B1:RS232C:CONDition? might return :TRIGGER:A:BUS:B1:RS232C:CONDITION START indicating start is the trigger condition.</pre>        |

## TRIGger:{A|B}:BUS:B<x>:RS232C:DATa:SIZE

This command sets or queries the length of the data string in bytes to be used for an RS-232C trigger when the trigger condition is Data. The bus number is specified by x.

|                   |                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.                                                                                                                                                                                                     |
| <b>Group</b>      | Trigger                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:RS232C:DATa:SIZE <NR3><br>TRIGger:{A B}:BUS:B<x>:RS232C:DATa:SIZE?                                                                                                                                                                                        |
| <b>Arguments</b>  | <NR3> specifies the data size in bytes.                                                                                                                                                                                                                                          |
| <b>Examples</b>   | TRIGGER:A:BUS:B1:RS232C:DATa:SIZE 3 sets three bytes data size for the RS-232C bus B1 trigger.<br><br>TRIGGER:A:BUS:B1:RS232C:DATa:SIZE? might return<br>:TRIGGER:A:BUS:B1:RS232C:DATa:SIZE 2, indicating that the data size for the RS-232C bus B1 trigger is set to two bytes. |

## TRIGger:{A|B}:BUS:B<x>:RS232C:DATa:VALue

This command sets or queries the data address string used for the RS-232 bus trigger when the trigger condition is set to Data. The bus number is specified by x.

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.                                |
| <b>Group</b>      | Trigger                                                                                                     |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:RS232C:DATa:VALue <QString><br>TRIGger:{A B}:BUS:B<x>:RS232C:DATa:VALue?             |
| <b>Arguments</b>  | <QString> specifies the address value. The argument is a string of 0, 1, or X representing a binary number. |

**Examples** TRIGGER:A:BUS:B1:RS232C:DATA:VALUE "011XX11" sets the data address string used for the RS-232 bus trigger to 011XX11.

TRIGGER:A:BUS:B1:RS232C:DATA:VALUE? might return  
:TRIGGER:A:BUS:RS232C:DATA:VALUE "XXXXXX01", indicating that the data address string used for the RS-232 bus trigger is set to "XXXXXX01"

## TRIGger:{A|B}:BUS:B<x>:SENT:CONDition

This command sets or queries the trigger condition for a SENT bus.

**Conditions** Requires option SRAUTOSEN.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:CONDition  
{START|FAST|SLOW|ERRor}  
TRIGger:{A|B}:BUS:B<x>:SENT:CONDition?

**Arguments** B<x> is the number of the bus waveform.

START sets triggering on start of packet.

FAST sets triggering on fast channel packets.

SLOW sets triggering on slow channel packets.

ERRor sets triggering on errors.

**Examples** TRIGGER:A:BUS:B1:SENT:CONDITION START specifies triggering on start of packet.

TRIGGER:A:BUS:B1:SENT:CONDITION? might return  
TRIGGER:A:BUS:B1:SENT:CONDITION ERRor, indicating the bus is triggering on errors.

## TRIGger:{A|B}:BUS:B<x>:SENT:ERRType

This command sets or queries the error type to be used when triggering on SENT data.

**Conditions** Requires option 5SRAUTOSEN.

The SENT bus trigger condition is set to ERRor.

|                         |                                                                                                                                                                                                                |

| <b>Arguments</b>        | B<x> is the number of the bus waveform.<br>CRC specifies triggering on CRC errors.                                                                                                                             |
| <b>Examples</b>         | TRIGGER:A:BUS:B1:SENT:ERRTYPE CRC sets the bus to trigger on CRC errors.<br>TRIGGER:A:BUS:B1:SENT:ERRTYPE? might return<br>:TRIGGER:A:BUS:B1:SENT:ERRTYPE CRC to indicate the bus is triggering on CRC errors. |

## TRIGger:{A|B}:BUS:B<x>:SENT:ERRType:CRc

This command sets or queries the CRC error type to be used when triggering on SENT data.

|                         |                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SRAUTOSEN.<br>The SENT bus trigger condition is set to ERRor.<br>The ERRType is set to CRc.                                                                       |
| <b>Group</b>            | Trigger                                                                                                                                                                           |
| <b>Syntax</b>           | TRIGger:{A B}:BUS:B<x>:SENT:ERRType:CRc {FAST SLOW}<br>TRIGger:{A B}:BUS:B<x>:SENT:ERRType:CRc?                                                                                   |
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:CONDition</a><br><a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:ERRType</a>                                                          |
| <b>Arguments</b>        | B<x> is the number of the bus waveform.<br>FAST specifies triggering on CRC errors in only the Fast Channel.<br>SLOW specifies triggering on CRC errors in only the slow channel. |

**Examples** TRIGGER:A:BUS:B1:SENT:ERRTYPE:CRC FAST sets the bus to trigger on Fast Channel CRC errors.

TRIGGER:A:BUS:B1:SENT:ERRTYPE:CRC? might return  
TRIGGER:A:BUS:B1:SENT:ERRTYPE:CRC FAST to indicate that the bus is triggering on Fast Channel CRC errors.

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:HIVALue

This command sets or queries the high binary fast channel 1 value to use when triggering on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
The SENT bus trigger condition must be set to FAST.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:HIVALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

**Arguments** B<x> is the bus identifier number.  
<QString> sets the Fast Channel 1 binary data high value.

**Examples** TRIGger:A:BUS:B12:SENT:FAST:CHAN1A:HIVALue "XXXXXXXXXXXX" sets the SENT bus B12 Fast Channel 1 high value to XXXXXXXXXXXXXXX, or "don't care."

TRIGger:A:BUS:B3:SENT:FAST:CHAN1A:HIVALue? might return  
TRIGGER:A:BUS:B3:SENT:FAST:CHAN1A:HIVALUE "0101XXXX1111", indicating the SENT bus B3 Fast Channel 1 high is set to the binary value 0101XXXX1111.

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:QUALifier

This command sets or queries the qualifier to be used when triggering on SENT fast packet bus data for device channel 1.

**Conditions** Requires option SRAUTOSEN

The SENT bus trigger condition must be set to FAST.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:  
 QUALifier {Equal|UNEQUAL|LESSThan|MOREthan|  
 LESSEQUAL|MOREEQUAL|INrange|OUTrange}  
 TRIGGER:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:QUALifier?

**Related Commands** [TRIGGER:{A|B}:BUS:B<x>:SENT:CONDition](#)  
[TRIGGER:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:VALue](#)

**Arguments** B<x> is the number of the bus.  
 EQUAL sets the qualifier as Equal.  
 LESSEQUAL sets the qualifier as Less Than or Equal to.  
 LESSThan sets the qualifier as Less Than.  
 MOREEQUAL sets the qualifier as More Than or Equal to.  
 MOREthan sets the qualifier as More Than.  
 UNEQUAL sets the qualifier as Unequal.  
 INrange sets the qualifier to inside a range.  
 OUTrange sets the qualifier to outside a range.

**Examples** TRIGGER:A:BUS:B2:SENT:FAST:CHAN1A:QUALIFIER UNEQUAL sets the fast channel 1 data qualifier trigger to not equal for bus 2.  
 TRIGGER:A:BUS:B5:SENT:FAST:CHAN1A:QUALIFIER? might return  
 TRIGGER:A:BUS:B1:SENT:FAST:CHAN1A:QUALIFIER MOREEQUAL to indicate that the fast channel 1 data qualifier trigger is set to greater than or equal for bus 5.

## TRIGGER:{A|B}:BUS:B<x>:SENT:FAST:CHAN1A:VALue

This command sets or queries the binary fast channel 1 value to be used when triggering on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
 The search trigger condition must be set to FAST.

|                         |                                                                                                                                                                                                                                                                                                                                   |

| <b>Arguments</b>        | <p>B&lt;x&gt; is the number of the bus waveform.</p> <p>&lt;QString&gt; is the Fast Channel 1 value on which to trigger.</p>                                                                                                                                                                                                      |
| <b>Examples</b>         | <pre>TRIGGER:A:BUS:B1:SENT:FAST:CHAN1A:VALUE "XXXXXXXXXXXX" sets the Fast Channel 1 value to trigger on XXXXXXXXXXXXX, or "don't care."  TRIGGER:A:BUS:B1:SENT:FAST:CHAN1A:VALUE? might return :TRIGGER:A:BUS:B1:SENT:FAST:CHAN1A:VALUE "0000XXXX1111" to indicate the Fast Channel 1 binary trigger value is 0000XXXX1111.</pre> |

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:HIVALue

This command sets or queries the high binary fast channel 2 value to use when triggering on a SENT bus signal.

|                         |                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | <p>Requires option SRAUTOSEN.</p> <p>The SENT bus trigger condition must be set to FAST.</p>                                            |
| <b>Group</b>            | Trigger                                                                                                                                 |
| <b>Syntax</b>           | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:FAST:CHAN2B:HIVALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:FAST:CHAN2B:HIVALue?</pre> |
| <b>Related Commands</b> | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:CONDition</pre>                                                                                  |
| <b>Arguments</b>        | <p>B&lt;x&gt; is the bus identifier number.</p> <p>&lt;QString&gt; sets the Fast Channel 2 high binary data value.</p>                  |

**Examples** TRIGger:A:BUS:B2:SENT:FAST:CHAN2B:HIVALue "10000000000" sets the SENT bus B2 Fast Channel 2 high value to 10000000000.

TRIGger:A:BUS:B4:SENT:FAST:CHAN2B:HIVALue? might return TRIGGER:A:BUS:B4:SENT:FAST:CHAN2B:HIVALUE "0101XXXX1111", indicating the SENT bus B4 Fast Channel 2 high is set to the binary value 0101XXXX1111.

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:QUALifier

This command sets or queries the qualifier to be used when triggering on SENT fast packet bus data for device channel 2.

**Conditions** Requires option SRAUTOSEN.  
The SENT bus trigger condition must be set to FAST.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:  
QUALifier {EQua1|UNEQua1|LESSthan|MOREthAn|  
LESSEQua1|MORREEQua1|INrange|OUTrange}  
TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:QUALifier?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:VALue](#)

**Arguments** B<x> is the number of the bus.  
EQua1 sets the qualifier as Equal.  
LESSEQua1 sets the qualifier as Less Than or Equal to.  
LESSthan sets the qualifier as Less Than.  
MORREEQua1 sets the qualifier as More Than or Equal to.  
MOREthAn sets the qualifier as More Than.  
UNEQua1 sets the qualifier as Unequal.  
INrange sets the qualifier to inside a range.  
OUTrange sets the qualifier to outside a range.

**Examples** TRIGGER:A:BUS:B2:SENT:FAST:CHAN2B:QUALIFIER UNEQUAL sets the fast channel 2 data qualifier trigger to not equal for bus 2.

TRIGGER:A:BUS:B5:SENT:FAST:CHAN2B:QUALIFIER? might return TRIGGER:A:BUS:B1:SENT:FAST:CHAN2B:QUALIFIER MOREEQUAL to indicate that the fast channel 2 data qualifier trigger is set to greater than or equal for bus 5.

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:VALue

This command sets or queries the binary fast channel 2 value to be used when triggering on a SENT bus signal. The trigger condition must be set to FAST.

**Conditions** Requires option SRAUTOSEN.

The search condition must be set to FAST.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:SENT:FAST:CHAN2B:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:SENT:PAUSE:QUALifier](#)

**Arguments** B<x> is the number of the bus waveform.  
<QString> is the Fast Channel 2 binary value on which to trigger.

**Examples** TRIGGER:A:BUS:B1:SENT:FAST:CHAN2B:VALUE "111111111111" sets the Fast Channel 2 value on which to trigger to 111111111111.

TRIGGER:A:BUS:B1:SENT:FAST:CHAN2B:VALUE? might return :TRIGGER:A:BUS:B1:SENT:FAST:CHAN2B:VALUE "000000000000" to indicate the Fast Channel 2 binary value on which to trigger is 000000000000.

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:COUNTER:HIVALue

This command sets or queries the high binary fast message counter value to be used when triggering on a SENT bus signal.

| <b>Examples</b>         | <p>TRIGGER:A:BUS:B1:SENT:FAST:COUNTER:HIVALUE "XXXXXXXX" sets the Fast Channel 1 secure counter high value to "don't care."</p> <p>TRIGGER:A:BUS:B3:SENT:FAST:COUNTER:HIVALUE? might return TRIGGER:A:BUS:B3:SENT:FAST:COUNTER:HIVALUE "11110000" to indicate a binary value of 11110000.</p> |

## TRIGger:{A|B}:BUS:B<x>:SENT:FAST:COUNTER:QUALifier

This command sets or queries the qualifier to be used when triggering on SENT fast packet bus data for the secure format counter.

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b> | <p>Requires option SRAUTOSEN.</p> <p>The SENT bus trigger condition must be set to FAST.</p>                                           |
| <b>Group</b>      | Trigger                                                                                                                                |
| <b>Syntax</b>     | <p>TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:FAST:COUNTER:QUALifier {EQUAL UNEQUAL LESSTHAN MORETHAN LESSEQUAL MOREEQUAL INRANGE OUTRANGE}</p> |

TRIGger: {A|B}:BUS:B<x>:SENT:FAST:COUNTER:QUALifier?

**Related Commands**    [TRIGger: {A|B}:BUS:B<x>:SENT:CONDition](#)  
[TRIGger: {A|B}:BUS:B<x>:SENT:FAST:COUNTER:VALue](#)

**Arguments**    B<x> is the number of the bus.  
 EQUa1 sets the qualifier as Equal.  
 LESSEQUa1 sets the qualifier as Less Than or Equal to.  
 LESSThan sets the qualifier as Less Than.  
 MOREEQUa1 sets the qualifier as More Than or Equal to.  
 MOREthan sets the qualifier as More Than.  
 UNEQUa1 sets the qualifier as Unequal.  
 INrange sets the qualifier to inside a range.  
 OUTrange sets the qualifier to outside a range.

**Examples**    TRIGGER:A:BUS:B2:SENT:FAST:COUNTER:QUALIFIER UNEQUAL sets the fast channel 2 counter qualifier trigger to not equal for bus 2.  
 TRIGGER:A:BUS:B5:SENT:FAST:COUNTER:QUALIFIER? might return TRIGGER:A:BUS:B1:SENT:FAST:COUNTER:QUALIFIER MOREEQUAL to indicate that the fast channel 2 counter qualifier trigger is set to greater than or equal for bus 5.

## TRIGger: {A|B}:BUS:B<x>:SENT:FAST:COUNTER:VALue

This command sets or queries the binary fast message counter value to be used when triggering on a SENT bus signal.

**Conditions**    Requires option SRAUTOSEN.  
 The search condition must be set to FAST.  
 The number of channels must be set to 1.  
 The nibble count must be set to 6.

**Group**    Trigger

| <b>Conditions</b>       | <p>Requires option SRAUTOSEN.</p> <p>The search condition must be set to FAST.</p> <p>The number of channels must be set to 1.</p> <p>The nibble count must be set to 6.</p> |
| <b>Group</b>            | Trigger                                                                                                                                                                      |
| <b>Syntax</b>           | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:FAST:INVERTNIBble:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:FAST:INVERTNIBble:VALue?</pre>                              |
| <b>Related Commands</b> | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:SENT:CONDition BUS:B&lt;x&gt;:SENT:NIBBLECount</pre>                                                                                       |

[BUS:B<x>:SENT:NUMCHANnel](#)

**Arguments** B<x> is the number of the bus waveform.  
 <QString> is the Fast Channel 1 inverted nibble binary value on which to trigger.

**Examples** TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE "XXXX" sets the Fast Channel 1 secure inverted nibble value to "don't care."  
 TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE? might return :TRIGGER:A:BUS:B1:SENT:FAST:INVERTNIBBLE:VALUE "1111" to indicate a binary value of 1111.

**TRIGger:{A|B}:BUS:B<x>:SENT:FAST:STATus:VALue**

This command sets or queries the binary status value to be used when triggering on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.  
 The search trigger condition must be set to FAST.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:FAST:STATus:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:SENT:FAST:STATus:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

**Arguments** B<x> is the number of the bus waveform.  
 <QString> is the binary status value on which to trigger.

**Examples** TRIGger:A:BUS:B1:SENT:FAST:STATus:VALue "XXXX" sets the binary status trigger value to XXXX.  
 TRIGGER:A:BUS:B1:SENT:FAST:STATUS:VALUE? might return :TRIGGER:A:BUS:B1:SENT:FAST:STATUS:VALUE "1010" to indicate a binary trigger value is 1010.

## TRIGger:{A|B}:BUS:B<x>:SENT:PAUSE:QUALifier

This command sets or queries the qualifier to be used when triggering on SENT pause pulses.

**Conditions** Requires option SRAUTOSEN.

The SENT bus trigger condition must be set to PAUSE.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:PAUSE:QUALifier {Equal|UNEQUAL|LESSThan|MOREthan|LESSEQUAL|MOREEQUAL|INrange|OUTrange}  
TRIGger:{A|B}:BUS:B<x>:SENT:PAUSE:QUALifier?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:HIVALue](#)

[SEARCH:SEARCH<x>:TRIGger:A:BUS:SENT:PAUSE:TICKs:VALue](#)

**Arguments** B<x> is the bus identifier number.

EQUAL sets the qualifier as Equal.

INrange sets the qualifier to in range.

LESSEQUAL sets the qualifier as Less Than or Equal to.

LESSThan sets the qualifier as Less Than.

MOREEQUAL sets the qualifier as More Than or Equal to.

MOREthan sets the qualifier as More Than.

OUTrange sets the qualifier to out of range.

UNEQUAL sets the qualifier as Unequal.

**Examples** TRIGGER:A:BUS:B2:SENT:PAUSE:QUALifier UNEQUAL sets the pause pulse qualifier trigger to not equal for bus 2.

TRIGGER:A:BUS:B1:SENT:PAUSE:QUALIFIER? might return  
:TRIGGER:A:BUS:B1:SENT:PAUSE:QUALIFIER INRANGE to indicate that the pause pulse qualifier is set to trigger inside the range of ticks low and ticks high on bus 1.

## TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:HIVALue

This command sets or queries the high binary Slow channel data value to use when triggering on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN.

The SENT bus trigger condition must be set to SLOW.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:HIVALue <QString>  
TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:HIVALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

**Arguments** B<x> is the bus identifier number.

<QString> sets the binary Slow channel data value.

**Examples** TRIGGER:A:BUS:B1:SENT:SLOW:DATA:HIVALUE "XXXXXXXX" sets the Slow data high value to "don't care."

TRIGGER:A:BUS:B1:SENT:SLOW:DATA:HIVALUE? might return  
TRIGGER:A:BUS:B1:SENT:SLOW:DATA:HIVALUE "11110001", to indicate triggering on Slow data values that match 11110001.

## TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:QUALifier

This command sets or queries the binary identifier value to use when triggering on a SENT bus signal.

**Conditions** Requires option SRAUTOSEN

The SENT bus trigger condition must be set to SLOW.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:QUALifier {Equal|  
UNEQUAL| LESSthan| MOREthan| LESSEQUAL| MOREEQUAL|  
INrange|OUTrange}  
TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:QUALifier?

**Related Commands**    [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

**Arguments**    B<x> is the bus identifier number.  
 EQual specifies the qualifier as Equal.  
 UNEQual specifies the qualifier as Not Equal to.  
 LESSthan specifies the qualifier as Less Than.  
 MOREthan specifies the qualifier as More Than.  
 LESSEQual specifies the qualifier as Less Than or Equal to.  
 MOREEQual specifies the qualifier as More Than or Equal to.  
 INrange sets the qualifier to inside a range.  
 OUTrange sets the qualifier to outside a range.

**Examples**    TRIGger:{A|B}:BUS:B2:SENT:SLOW:DATA:QUALIFIER LESSEQUAL sets the slow channel data qualifier to less than or equal for bus 2.  
 TRIGger:{A|B}:BUS:B5:SENT:SLOW:DATA:QUALIFIER? might return :TRIGger:{A|B}:BUS:B5:SENT:SLOW:DATA:QUALIFIER EQUAL to indicate that the slow channel data qualifier is set to equal on bus 5.

## TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:VALue

This command sets or queries the binary slow channel value to use when triggering on a SENT bus signal.

**Conditions**    Requires option SRAUTOSEN  
 The SENT bus trigger condition must be set to SLOW.

**Group**    Trigger

**Syntax**    TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:VALue <Qstring>  
 TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:VALue?

**Related Commands**    [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)

**Arguments**    B<x> is the bus identifier number.  
 <Qstring> is the binary slow channel data value.

- Examples** TRIGGER:A:BUS:B2:SENT:SLOW:DATA:VALUE "XXXXXXXX" sets the slow data value to "don't care" for bus 2.
- TRIGGER:A:BUS:B4:SENT:SLOW:DATA:VALUE? might return  
:TRIGGER:A:BUS:B4:SENT:SLOW:DATA:VALUE "XXXX1111", to indicate triggering on slow data values that match XXXX1111 on bus 4.

## TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:IDentifier:VALue

This command sets or queries the qualifier to use when triggering on SENT slow packet bus data.

- Conditions** Requires option SRAUTOSEN  
The SENT bus trigger condition must be set to SLOW.
- Group** Trigger
- Syntax** TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:IDentifier:VALue <Qstring>  
TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:IDentifier:VALue?
- Related Commands** [TRIGger:{A|B}:BUS:B<x>:SENT:CONDition](#)  
[TRIGger:{A|B}:BUS:B<x>:SENT:SLOW:DATA:VALue](#)
- Arguments** B<x> is the bus identifier number.  
<Qstring> is the binary identifier value.
- Examples** TRIGGER:A:BUS:B3:SENT:SLOW:IDENTIFIER:VALUE "XXXX" sets the identifier value to "don't care" for bus 3.
- TRIGGER:A:BUS:B1:SENT:SLOW:IDENTIFIER:VALUE? might return  
:TRIGGER:A:BUS:B1:SENT:SLOW:IDENTIFIER:VALUE "0001" to indicate the slow channel identifier is set to 0001 on bus 1.

## TRIGger:{A|B}:BUS:B<x>:SPI:CONDition

This command specifies the trigger condition for a SPI trigger. The bus number is specified by x.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Arguments</b>        | B<x> is the bus identifier number.<br>SS specifies the Slave Selection condition.<br>STARTofframe is applicable when BUS:B<x>:SPI:FRAMING is set to IDLEtime. When the trigger condition is set to STARTofframe, the instrument triggers on the first SPI clock after an idle time when there are no clocks.<br>DATA sets the trigger condition to Master-In Slave-Out and Master-Out Slave-In. |

## TRIGger:{A|B}:BUS:B<x>:SPI:DATA:SIZE

This command specifies the length of the data string to be used for a SPI trigger if the trigger condition is DATA. The bus number is specified by x.

|                   |                                                                                        |
|-------------------|----------------------------------------------------------------------------------------|
| <b>Conditions</b> | Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.           |
| <b>Group</b>      | Trigger                                                                                |
| <b>Syntax</b>     | TRIGger:{A B}:BUS:B<x>:SPI:DATA:SIZE <NR1><br>TRIGger:{A B}:BUS:B<x>:SPI:DATA:SIZE?    |
| <b>Arguments</b>  | B<x> is the bus identifier number.<br><NR1> is the length of the data string in bytes. |

**Examples** TRIGger:A:BUS:B1:SPI:DATA:SIZE 1 sets the data size to 1 byte.  
 TRIGger:A:BUS:B1:SPI:DATA:SIZE? might return  
 :TRIGGER:A:BUS:B1:SPI:DATA:SIZE 1 indicating the data size is  
 1 byte.

## TRIGger:{A|B}:BUS:B<x>:SPI:DATA:VALue

This command specifies the binary data string used for SPI triggering if the trigger condition is DATA. The bus number is specified by x.

**Conditions** Requires option 5-SRCOMP or SUP5-SRCOMP Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SPI:DATA:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:SPI:DATA:VALue?

**Arguments** B<x> is the bus identifier number.  
 <QString> specifies the data value in the specified valid format. The valid characters are 0, 1, and X for binary format.

**Examples** TRIGger:A:BUS:B1:SPI:DATA:VALue "11011010" sets the data value to  
 11011010.  
 TRIGger:A:BUS:B1:SPI:DATA:VALue? might return  
 :TRIGGER:A:BUS:B1:SPI:DATA:VALUE "XXXXXXXX" indicating  
 the data value is XXXXXXXX.

## TRIGger:{A|B}:BUS:B<x>:SPMI:CONDition

This command sets or queries the trigger condition for the specified SPMI bus.

**Conditions** Requires option SRPM

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SPMI:CONDition {SSC|RESet|SLEep|  
 SHUTdown|WAKEup|MASTERREAd|MASTERWRITe|REGREAd|REGWRITe|

DEVICEDESCMASTERREAD|DEVICEDESCSLAVEREAD|EXTREGREAD|  
EXTREGWRITE|LONGEXTREGREAD|LONGEXTREGWRITE|REGOWRITE|  
AUTHENTICATE|TRANSFERBUSOWNERSHIP|PARITYERROR}  
TRIGGER:{A|B}:BUS:B<x>:SPMI:CONDITION?

**Arguments**

B<x> is the bus identifier number.

SSC specifies triggering on the Sequence Start Condition.

RESET specifies triggering on the Reset command sequence.

SLEEP specifies triggering on the Sleep command sequence.

SHUTDOWN specifies triggering on the Shutdown command sequence.

WAKEUP specifies triggering on the Wakeup command sequence.

MASTERREAD specifies triggering on the Master Read command sequence.

MASTERWRITE specifies triggering on the Master Write command sequence.

REGREAD specifies triggering on the Register Read command sequence.

REGWRITE specifies triggering on the Register Write command sequence.

DEVICEDESCMASTERREAD specifies triggering on the Device Descriptor Block Master Read command sequence

DEVICEDESCSLAVEREAD specifies triggering on the Device Descriptor Block Slave Read command sequence.

EXTREGREAD specifies triggering on the Extended Register Read command sequence.

EXTREGWRITE specifies triggering on the Extended Register Write command sequence.

LONGEXTREGREAD specifies triggering on the Extended Register Read Long command sequence.

LONGEXTREGWRITE specifies triggering on the Extended Register Write Long command sequence.

REGOWRITE specifies triggering on the Register 0 Write command sequence.

AUTHENTICATE specifies triggering on the Authentication command sequence.

TRANSFERBUSOWNERSHIP specifies triggering on the Transfer Bus Ownership (TBO) command sequence.

PARITYERROR specifies triggering on the parity errors.

**Examples**

TRIGGER:A:BUS:B5:SPMI:CONDITION SLEEP specifies triggering on a Sleep command sequence for bus B5.

TRIGGER:A:BUS:B2:SPMI:CONDITION? might return  
:TRIGGER:A:BUS:B2:SPMI:CONDITION MASTERREAD, indicating  
that bus B2 is triggering on Master Read command sequences.

## TRIGger:{A|B}:BUS:B<x>:SPMI:DATA:SIZE

This command sets or queries the length of the data string, in bytes, to be used when triggering on an SPMI bus signal.

|                         |                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SRPM.<br><br>The trigger condition must be set to EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, or LONGEXTREGWRItE.<br><br>Note that this a floating point value. If the condition is set to REG0WRItE, the query return value will be a fractional value (0.875) because the data size is less than a byte. |
| <b>Group</b>            | Trigger                                                                                                                                                                                                                                                                                                                 |

**Examples** TRIGGER:A:BUS:B3:SPMI:MASTERADDRESS:VALUE "XX" sets the binary master address trigger of bus B3 to "don't care."

TRIGGER:A:BUS:B1:SPMI:MASTERADDRESS:VALUE? might return TRIGGER:A:BUS:B1:SPMI:MASTERADDRESS:VALUE "11" to indicate the binary master address on which to trigger for bus B1 is set to binary 11.

## TRIGger:{A|B}:BUS:B<x>:SPMI:NOESPonse

This command sets or queries whether or not to trigger on No Response frames.

**Conditions** Requires option SRPM

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SPMI:NOESPonse <QString>  
TRIGger:{A|B}:BUS:B<x>:SPMI:NOESPonse?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:SPMI:CONDition](#)

**Arguments** B<x> is the bus identifier number.  
<QString> is either TRUE or FALSE boolean value.

**Examples** TRIGGER:A:BUS:B4:SPMI:NOESPONSE TRUE set the bus B4 to look for No Response frames.

TRIGGER:A:BUS:B1:SPMI:NOESPONSE? might return  
:TRIGGER:A:BUS:B1:SPMI:NOESPONSE FALSE to indicate that bus B4 is not looking for No Response frames.

## TRIGger:{A|B}:BUS:B<x>:SPMI:REGISTERADDRess:VALue

This command sets or queries the binary data string that identifies the register address used in SPMI triggering if the trigger condition is MASTERREAd, MASTERWRItE, REGREAd, REGWRItE, EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, or LONGEXTREGWRItE.

**Conditions** Requires option SRPM

**Group** Trigger

|                         |                                                                                                                                                                                                                                                                                                                                       |

| <b>Arguments</b>        | <p>B&lt;x&gt; is the bus identifier number.</p> <p>&lt;QString&gt; is the binary data string that identifies the register address.</p>                                                                                                                                                                                                |
| <b>Examples</b>         | <p>TRIGGER:A:BUS:B2:SPMI:REGISTERADDRESS:VALUE "XXXXXXXX" sets the binary register address of bus B2 to "don't care."</p> <p>TRIGGER:A:BUS:B1:SPMI:REGISTERADDRESS:VALUE? might return TRIGGER:A:BUS:B1:SPMI:REGISTERADDRESS:VALUE "XXXX1111" to indicate the binary register address on which to trigger for bus B1 is XXXX1111.</p> |

## TRIGger:{A|B}:BUS:B<x>:SPMI:SLAVEADDRESS:VALue

This command sets or queries the binary data string that identifies the slave address used in SPMI triggering if the trigger condition is RESet, SLEep, SHUTdown, WAKeup, AUTHenticate, REGREAd, REGWRItE, EXTREGREAd, EXTREGWRItE, LONGEXTREGREAd, LONGEXTREGWRItE, DEVICEDESCSLAVEREAd, or REG0WRItE.

|                         |                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option SRPM                                                                                                                                    |
| <b>Group</b>            | Trigger                                                                                                                                                 |
| <b>Syntax</b>           | <pre>TRIGger:{A B}:BUS:B&lt;x&gt;:SPMI:SLAVEADDRESS:VALue &lt;QString&gt; TRIGger:{A B}:BUS:B&lt;x&gt;:SPMI:SLAVEADDRESS:VALue?</pre>                   |
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:SPMI:CONDition</a>                                                                                             |
| <b>Arguments</b>        | <p>B&lt;x&gt; is the bus identifier number.</p> <p>&lt;QString&gt; is the binary data string that identifies the slave address on which to trigger.</p> |
| <b>Examples</b>         | <p>TRIGGER:A:BUS:B1:SPMI:SLAVEADDRESS:VALUE "0011" sets the binary slave address of bus B1 to 0011.</p>                                                 |

:TRIGGER:A:BUS:B4:SPMI:SLAVEADDRESS:VALUE? might return TRIGGER:A:BUS:B4:SPMI:SLAVEADDRESS:VALUE "1010" to indicate that bus B4 is triggering on binary slave address 1010.

## TRIGger:{A|B}:BUS:B<x>:SVID:COMManD:RESPonse

This command sets or queries the command response for SVID bus. The bus number is specified by x.

**Conditions** Requires option SR-SVID.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:SVID:COMManD:RESPonse  
 {GETREG| GETREGVENDOR| GETREGTESTCFG| SETVIDFAST|  
 SETVIDSLOW| SETVIDDECAY| SETPS| SETREGADDR| SETREGDATA|  
 SETREGADDRVENDOR| SETREGDATAVENDOR| SETREGADDRTESTCFG|  
 SETREGDATATESTCFG| TESTMODE| SETWP| GETREGPKTRECt|  
 GETREGPKTALERT| GETREGPKTBAD| GETREGVREVENT}  
 TRIGger:{A|B}:BUS:B<x>:SVID:COMManD:RESPonse?

**Arguments** GETREG sets the command response to GetReg. This is the default value.  
 GETREGVENDOR sets the command response to GetRegVendor.  
 GETREGTESTCFG sets the command response to GetRegTestCfg.  
 SETVIDFAST sets the command response to SetVID Fast.  
 SETVIDSLOW sets the command response to SetVID Slow.  
 SETVIDDECAY sets the command response to SetVID Decay.  
 SETPS sets the command response to SetPS.  
 SETREGADDR sets the command response to SetRegAddr.  
 SETREGDATA sets the command response to SetRegData.  
 SETREGADDRVENDOR sets the command response to SetRegAddrVendor.  
 SETREGDATAVENDOR sets the command response to SetRegDataVendor.  
 SETREGADDRTESTCFG sets the command response to SetRegAddrTestCfg.  
 SETREGDATATESTCFG sets the command response to SetRegDataTestCfg.  
 TESTMODE sets the command response to Test Mode.  
 SETWP sets the command response to SetWP.

GETREGPKTRECent sets the command response to GetRegPktRecent.

GETREGPKTALERT sets the command response to GetRegPktAlert.

GETREGPKTBAD sets the command response to GetRegPktBad.

GETREGVREVENT sets the command response to GetRegVrEvent.

**Examples** TRIGGER:A:BUS:B1:SVID:COMMAND:RESPONSE GETREGVENDOR specifies GetRegVendor as the command response within a SVID frame to trigger on.

TRIGGER:A:BUS:B1:SVID:COMMAND:RESPONSE? might return :TRIGGER:A:BUS:B1:SVID:COMMAND:RESPONSE GETREGVENDOR, indicating that GETREGVENDOR is the currently specified command response within a SVID.

## TRIGGER:{A|B}:BUS:B<x>:SVID:COMMAND:TYPE

This command sets or queries the command type for SVID bus. The bus number is specified by x.

**Conditions** Requires option SR-SVID.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:BUS:B<x>:SVID:COMMAND:TYPE {GET|SET|OPTIONAL}  
TRIGGER:{A|B}:BUS:B<x>:SVID:COMMAND:TYPE?

**Arguments** GET sets the command type to get. This is the default value.

SET sets the command type to set.

OPTIONAL sets the command type to optional.

**Examples** TRIGGER:A:BUS:B1:SVID:COMMAND:TYPE GET specifies GET as the command type within a SVID frame to trigger on.

TRIGGER:A:BUS:B1:SVID:COMMAND:TYPE? might return :TRIGGER:A:BUS:B1:SVID:COMMAND:TYPE GET, indicating that GET is the currently specified command type within a SVID frame to trigger on.

## TRIGger:{A|B}:BUS:B<x>:SVID:CONDition

This command sets or queries the trigger condition for a SVID bus to trigger on. The bus number is specified by x.

## TRIGger:{A|B}:BUS:B<x>:USB:ADDReSS:VALue

This command specifies the binary address string to be used for USB trigger. The trigger condition must be set to TOKEN. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:ADDReSS:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:USB:ADDReSS:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** B<x> is the bus identifier number.  
  
<QString> within the range 0000000 to 1111111 (00 hex to 7F hex).

**Examples** TRIGGER:A:BUS:B1:USB:ADDRESS:VALUE "0001000" sets the binary address to 0001000 (08 hex).  
  
TRIGGER:A:BUS:B1:USB:ADDRESS:VALUE? might return :TRIGGER:A:BUS:B1:USB:ADDRESS:VALUE "1000000", which indicates that the binary address is 100000 (40 hex).

## TRIGger:{A|B}:BUS:B<x>:USB:CONDition

This command specifies the trigger condition for the USB trigger. The bus number is specified by x.

## TRIGger:{A|B}:BUS:B<x>:USB:DATA:HIVALue

This command specifies the binary data string for the upper limit for inside-of-range and outside-of-range qualifiers for the USB trigger when the trigger condition is DATA. Use the command [TRIGger:{A|B}:BUS:B<x>:USB:DATA:VALue](#) to set the lower limit. The bus number is specified by x.

|                   |                                                                              |
|-------------------|------------------------------------------------------------------------------|

| <b>Arguments</b> | <NR1> is number in the range 1 to 16.                                                                                                                                                                                                                           |
| <b>Examples</b>  | TRIGGER:A:BUS:B1:USB:DATA:SIZE 4 sets the instrument to trigger on four contiguous data bytes.<br><br>TRIGGER:A:BUS:B1:USB:DATA:SIZE? might return<br>:TRIGGER:A:BUS:B1:USB:DATA:SIZE 6 indicating that the instrument will trigger on 6 contiguous data bytes. |

## TRIGger:{A|B}:BUS:B<x>:USB:DATA:TYPE

This command specifies the data type for a USB trigger. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:DATA:TYPE  
{ANY|DATA0|DATA1|DATA2|MDATA}  
TRIGger:{A|B}:BUS:B<x>:USB:DATA:TYPE?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** ANY indicates either a DATA0 or DATA1 data packet type.  
DATA0 indicates a DATA0 data packet type.  
DATA1 indicates a DATA1 data packet type.  
DATA2 indicates a DATA2 data packet type when on HIGH speed.  
MDATA indicates a MDATA data packet type when on HIGH speed.

**Examples** TRIGGER:A:BUS:B1:USB:DATA:TYPE DATA0 sets the instrument to trigger on a DATA0 data packet type.

TRIGGER:A:BUS:B1:USB:DATA:TYPE? might return  
:TRIGGER:A:BUS:B1:USB:DATA:TYPE DATA1, indicating that the data packet  
type is set to DATA1.

## TRIGger:{A|B}:BUS:B<x>:USB:DATA:VALue

This command specifies the binary data string to be used when triggering on a  
USB trigger.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis  
application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:DATA:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:USB:DATA:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** <QString> within the range 00000000 to 11111111 (00 hex to FF hex).

**Examples** TRIGGER:A:BUS:B1:USB:DATA:VALUE "00001000" sets the binary address  
to 00001000 (08 hex).

TRIGGER:A:BUS:B1:USB:DATA:VALUE? might return  
:TRIGGER:A:BUS:B1:USB:DATA:VALUE "01000000", which  
indicates that the binary address is 01000000 (40 hex).

## TRIGger:{A|B}:BUS:B<x>:USB:ENDPoint:VALue

This command specifies the binary endpoint string to be used for the USB trigger.  
The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis  
application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:ENDPoint:VALue <QString>  
 TRIGger:{A|B}:BUS:B<x>:USB:ENDPoint:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** <QString> within the range 0000 to 1111 (00 hex to 0F hex).

**Examples** TRIGGER:A:BUS:B1:USB:ENDPOINT:VALUE "1000" sets the binary address to 1000 (08 hex).

TRIGGER:A:BUS:B1:USB:ENDPOINT:VALUE? might return  
 :TRIGGER:A:BUS:B1:USB:ENDPOINT:VALUE "1001", which indicates that the binary address is 1001 (09 hex).

## TRIGger:{A|B}:BUS:B<x>:USB:ERRType

This command specifies the error type to be used when the trigger condition is set to ERRor. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:ERRType  
 {PID|CRC5|CRC16|BITSTUFFing}  
 TRIGger:{A|B}:BUS:B<x>:USB:ERRType?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** PID indicates the error type is set to packet ID.  
 CRC5 indicates the error type is set to 5-bit CRC.  
 CRC16 indicates the error type is set to 16-bit CRC.  
 BITSTUFFing indicates the error type is set to bit stuffing.

**Examples** TRIGGER:A:BUS:B1:USB:ERRTYPE PID sets the error trigger condition to packet ID.

TRIGGER:A:BUS:B1:USB:ERRTYPE? might return  
:TRIGGER:A:BUS:B1:USB:TYPE PID, indicating the error trigger condition is  
packet ID.

## TRIGger:{A|B}:BUS:B<x>:USB:HANDSHAKEType

This command specifies the handshake type for the USB trigger. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:HANDSHAKEType  
{ANY|NAK|ACK|STALL|NYET}  
TRIGger:{A|B}:BUS:B<x>:USB:HANDSHAKEType?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** ANY indicates the instrument will trigger on any handshake type.  
NAK indicates the instrument will trigger when a device cannot send or receive data.  
ACK indicates the instrument will trigger when a packet is successfully received.  
STALL indicates the instrument will trigger when a device requires intervention from the host.  
NYET specifies the handshake type as No response Yet (0110).

**Examples** TRIGGER:A:BUS:B1:USB:HANDSHAKETYPE ACK sets the handshake type to acknowledgement.

TRIGGER:A:BUS:B1:USB:HANDSHAKETYPE? might return  
:TRIGGER:A:BUS:B1:USB:HANDSHAKETYPE STALL, indicating that  
the handshake type is set to stall.

## TRIGger:{A|B}:BUS:B<x>:USB:SOFFRAMENUMber

This command specifies the binary data string to be used for start of frame number, when the trigger condition is Token Packet and the token type is Start of Frame. The bus number is specified by x.

| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:USB:CONDition</a>                                                                                                                                                                                                                                       |
| <b>Arguments</b>        | <QString> within the range 000 0000 0000 to 111 1111 1111 (000 hex to 7FF hex).                                                                                                                                                                                                                  |
| <b>Examples</b>         | TRIGGER:A:BUS:B1:USB:SOFFRAMENUMBER "00000001000" sets the start of frame number to 00000001000 (008 hex).<br><br>TRIGGER:A:BUS:B1:USB:SOFFRAMENUMBER? might return :TRIGGER:A:BUS:B1:USB:SOFFRAMENUMBER "00000001001", which indicates that the start of frame number is 00000001001 (009 hex). |

## TRIGger:{A|B}:BUS:B<x>:USB:SPECIALType

This command specifies the packet ID (PID) for the special packet. The bus number is specified by x.

|                         |                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conditions</b>       | Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.                                                               |
| <b>Group</b>            | Trigger                                                                                                                                    |
| <b>Syntax</b>           | TRIGger:{A B}:BUS:B<x>:USB:SPECIALType<br>{ANY ERROR PING PREAmble RESERVED SPLit}<br>TRIGger:{A B}:BUS:B<x>:USB:SPECIALType?              |
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:USB:CONDition</a>                                                                                 |
| <b>Arguments</b>        | ANY specifies the PID value as Any (XX00).<br>ERROR specifies the PID value as ERR (1100).<br>PING specifies the PID value as PING (0100). |

**PREAmble** specifies the PID value as PRE (1100).

**RESERVED** specifies the PID value as Reserved (0000).

**SPLit** specifies the PID value as Split (1000).

**Examples** `TRIGGER:A:BUS1:USB:SPECIALTYPE PREAMBLE` sets the special packet type to preamble.

`TRIGGER:A:BUS1:USB:SPECIALTYPE?` might return `:TRIGGER:A:BUS1:USB:SPECIALTYPE PREAMBLE`, indicating that the special type is set to preamble.

## **TRIGger:{A|B}:BUS:B<x>:USB:SPLit:ET:VALue**

When triggering on a high-speed USB split transaction, this command specifies the split transaction endpoint type value to trigger on. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** `TRIGger:{A|B}:BUS:B<x>:USB:SPLit:ET:VALue`  
`{NOCARE|CONTRo1|ISOchronous|BULK|INTERRUPT}`  
`TRIGger:{A|B}:BUS:B<x>:USB:SPLit:ET:VALue?`

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:SPECIALType](#)

**Arguments** `NOCARE` — any endpoint type.  
`CONTRo1` — control endpoint type.  
`ISOchronous` — isochronous endpoint type.  
`BULK` — bulk endpoint type (BULK-IN or BULK-OUT).  
`INTERRUPT` — interrupt endpoint type (Interrupt-IN).

**Examples** `TRIGger:A:BUS:B1:USB:SPLit:ET:VALue iso` sets the endpoint type to trigger on to isochronous.

`TRIGger:A:BUS:B1:USB:SPLit:ET:VALue?` might return `BULK`, indicating that the bulk endpoint type has been specified to trigger on.

**TRIGger:{A|B}:BUS:B<x>:USB:SPLit:HUB:VALue**

When triggering on a high-speed USB split transaction, this command specifies the split transaction hub address value to trigger on. The trigger condition must be set to Special with packet type SPLIT. The value can be up to 7 characters long. The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:SPLit:HUB:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:USB:SPLit:HUB:VALue?

**Related Commands** [TRIGger:{A|B}:BUS:B<x>:USB:SPECIALType](#)

**Arguments** <QString> is a quoted string of up to 7 characters. The valid characters are 0 and 1.

**Examples** TRIGger:A:BUS:B1:USB:SPLit:HUB:VALue "001010" sets the split transaction hub address to trigger on to 001010.

TRIGger:A:BUS:B1:USB:SPLit:HUB:VALue? might return XXXXXXXX, indicating that the hub address value to trigger on doesn't matter.

**TRIGger:{A|B}:BUS:B<x>:USB:SPLit:PORT:VALue**

When triggering on a high-speed USB split transaction, this command specifies the split transaction port address value to trigger on. The trigger condition must be set to Special with a packet type SPLIT. The value can be up to 7 characters long. The default is all X's (don't care). The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGger:{A|B}:BUS:B<x>:USB:SPLit:PORT:VALue <QString>  
TRIGger:{A|B}:BUS:B<x>:USB:SPLit:PORT:VALue?

|                         |                                                                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:USB:SPECIALType</a>                                                                                                                                                                                                   |
| <b>Arguments</b>        | <QString> is a quoted string of up to 7 characters. The valid characters are 0 and 1.                                                                                                                                                                          |
| <b>Examples</b>         | <p>TRIGger:A:BUS:B1:USB:SPLit:PORT:VALue "001010" sets the split transaction hub address to trigger on to 001010.</p> <p>TRIGger:A:BUS:B1:USB:SPLit:PORT:VALue? might return XXXXXXXX, indicating that the hub address value to trigger on doesn't matter.</p> |

## TRIGger:{A|B}:BUS:B<x>:USB:SPLit:SC:VALue

When triggering on a high-speed USB split transaction, this command specifies whether to trigger on the start or complete phase of the split transaction, based on the Start/Complete bit field value. (0 = Start, 1 = Complete). The default is NOCARE. The bus number is specified by x.

|                         |                                                                                                                                                                                                                                                                                                      |

## TRIGger:{A|B}:BUS:B<x>:USB:SPLit:SE:VALue

When triggering on a high-speed USB split transaction, this command specifies the split transaction start/end bit value to trigger on. The bus number is specified by x.

---

**NOTE.** *The start and end bits are interpreted based on the type of split transaction:*

*For Interrupt and control transactions, the S bit means Speed: 0 = Full Speed, 1 = Low Speed.*

*For bulk IN/OUT and isochronous IN start-split transactions, the S field must be 0.*

*For bulk/control IN/OUT, interrupt IN/OUT, and isochronous IN start-split transactions, the E field must be 0.*

*For full-speed isochronous OUT start-split transactions, the S (Start) and E (End) fields specify how the high-speed data payload corresponds to data for a full-speed data packet as shown below:*

*S E High-speed to Full-speed Data Relation*

*0 0 High-speed data is the middle of the full-speed data payload.*

*0 1 High-speed data is the end of the full-speed data payload.*

*1 0 High-speed data is the beginning of the full-speed data payload.*

*1 1 High-speed data is all of the full speed data payload.*

---

| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:BUS:B&lt;x&gt;:USB:SPECIALType</a>                                                                                           |
| <b>Arguments</b>        | NOCARE — any combination of S and E bits.<br>FULLSPEED — S bit = 0, E bit = 0.<br>LOWSPEED — S bit = 1, E bit = 0.<br>ISOSTART — S bit = 1, E bit = 0. |

ISOMID — see note above.

ISOEND — see note above.

ISOALL — see note above.

**Examples** TRIGGER:A:BUS:B1:USB:SPLIT:SE:VALUE ISOEND specifies to trigger on the ISOEND split transaction value.

TRIGGER:A:BUS:B1:USB:SPLIT:SE:VALUE? might return FULLSPEED.

## TRIGGER:{A|B}:BUS:B<x>:USB:TOKENType

This command specifies the token type for the USB trigger. The bus number is specified by x.

**Conditions** Requires option 5-SRUSB2 or SUP5-SRUSB2 Triggering and Analysis application.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:BUS:B<x>:USB:TOKENType {ANY|SOF|OUT|IN|SETUP}  
TRIGGER:{A|B}:BUS:B<x>:USB:TOKENType?

**Related Commands** [TRIGGER:{A|B}:BUS:B<x>:USB:CONDition](#)

**Arguments** ANY indicates any of the token types.  
SOF indicates a SOF (start-of-frame) token type  
OUT indicates an OUT token type.  
IN indicates an IN token type.  
SETUP indicates a SETUP token type.

**Examples** TRIGGER:A:BUS:B1:USB:TOKENType SETUP sets the token type to SETUP.

TRIGGER:A:BUS:B1:USB:TOKENType? might return  
:TRIGGER:A:BUS:B1:USB:TOKENType SOF if the token type is SOF.

## TRIGGER:{A|B}:BUS:SOURce

This command sets or queries the source bus for a bus trigger.

|                  |                                                                                                                                                                                                                        |

| <b>Group</b>     | Trigger                                                                                                                                                                                                                |
| <b>Syntax</b>    | TRIGger:{A B}:BUS:SOURce B<x><br>TRIGger:{A B}:BUS:SOURce?                                                                                                                                                             |
| <b>Arguments</b> | B<x> sets the selected source to the bus.                                                                                                                                                                              |
| <b>Examples</b>  | TRIGGER:A:BUS:SOURCE B2 sets the selected source for the bus trigger to Bus 2.<br>TRIGGER:A:BUS:SOURCE? might return TRIGGER:A:BUS:SOURCE B1, indicating that the selected source for the bus trigger is set to Bus 1. |

## TRIGger:{A|B}:EDGE:COUPling

This command sets or queries the type of coupling for the edge trigger. This command is equivalent to selecting Edge from the Trigger Type drop-down in the Trigger setup context menu, and choosing from the Coupling drop-down list.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>            | Trigger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Related Commands</b> | <a href="#">TRIGger:{A B}:EDGE:SOURce</a><br><a href="#">TRIGger:{A B}:EDGE:SLOpe</a>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Arguments</b>        | DC selects DC trigger coupling, which passes all input signals to the trigger circuitry.<br><br>HFRej coupling attenuates signals above 50 kHz before passing the signals to the trigger circuitry.<br><br>LFRej coupling attenuates signals below 80 kHz before passing the signals to the trigger circuitry.<br><br>NOISerej coupling provides stable triggering by increasing the trigger hysteresis. Increased hysteresis reduces the trigger sensitivity to noise but can require greater trigger signal amplitude. |

**Examples**     `TRIGGER:A:EDGE:COUPLING DC` sets the A edge trigger coupling to DC.  
`TRIGGER:A:EDGE:COUPLING?` might return `:TRIGGER:A:EDGE:COUPLING DC`, indicating that the A edge trigger coupling is set to DC.

## TRIGger:{A|B}:EDGE:SLOpe

This command sets or queries the slope for the edge trigger. This command is equivalent to selecting Edge from the Trigger Type drop-down in the Trigger setup context menu, and then choosing the desired Slope. This command is also equivalent to pressing the front-panel Slope button.

**Group**     Trigger

**Syntax**     `TRIGger:{A|B}:EDGE:SLOpe {RISe|FALL|EITHer}`  
`TRIGger:{A|B}:EDGE:SLOpe?`

**Related Commands**     [TRIGger:{A|B}:EDGE:SOUrce](#)  
[TRIGger:{A|B}:EDGE:COUPling](#)  
[TRIGger:B:STATE](#)

**Arguments**     `RISe` specifies to trigger on the rising or positive edge of a signal.  
`FALL` specifies to trigger on the falling or negative edge of a signal.  
`EITHer` specifies to trigger on either the rising or falling edge of a signal.

**Examples**     `TRIGGER:A:EDGE:SLOPE RISE` sets the A edge trigger slope to positive, which triggers on the rising edge of the signal.  
`TRIGGER:A:EDGE:SLOPE?` might return `:TRIGGER:A:EDGE:SLOPE FALL`, indicating that the A edge trigger slope is negative.

## TRIGger:{A|B}:EDGE:SOUrce

This command sets or queries the source for the edge trigger. For instruments that have an Auxiliary Input (such as the MSO58LP), AUXiliary can be selected as trigger source.

**Group**     Trigger

**Syntax** TRIGger:{A|B}:EDGE:SOURce {CH<x>|CH<x>\_D<y>|LINE|AUXiliary}  
 TRIGger:{A|B}:EDGE:SOURce?

**Related Commands** TRIGger:{A|B}:EDGE:SLOpe  
 TRIGger:{A|B}:EDGE:COUPling  
 TRIGger:B:STATE

**Arguments** CH<x> specifies an analog channel as the edge trigger source.  
 CH<x>\_D<y> specifies a digital channel as the edge trigger source.  
 LINE specifies AC line voltage, and is a valid source when B trigger is inactive.  
 AUXiliary specifies the Auxiliary Input.

**Examples** TRIGGER:A:EDGE:SOURCE CH2 sets the A edge trigger source to input channel 2.  
 TRIGGER:A:EDGE:SOURCE? might return :TRIGGER:A:EDGE:SOURCE CH1, indicating that the A edge trigger source is set to input channel 1.

## TRIGger:{A|B}:LEVel:CH<x>

This command sets or queries the CH<x> trigger level for an Edge, Pulse Width, Runt or Rise/Fall (Transition and Slew Rate) trigger when triggering on an analog channel waveform. Each channel can have an independent trigger level. The <x> is the channel number.

**Group** Trigger

**Syntax** TRIGger:{A|B}:LEVel:CH<x> <NR3>  
 TRIGger:{A|B}:LEVel:CH<x>?

**Arguments** <NR3> specifies the trigger level in user units (usually volts).

**Examples** TRIGGER:A:LEVEL:CH1 1.5 sets the A trigger level for Channel 1 to 1.5 V.  
 TRIGGER:A:LEVEL:CH2? might return :TRIGGER:A:LEVEL:CH2  
 1.3000E+00, indicating that the A trigger level for Channel 2 is set to 1.3 V.

## TRIGger:{A|B}:LOGIc:DELTaTime

This command specifies or queries the Logic trigger delta time value. The time value is used as part of the Logic trigger condition to determine if the duration of a logic pattern meets the specified time constraints.

|                  |                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                       |
| <b>Syntax</b>    | TRIGger:{A B}:LOGIc:DELTaTime <NR3><br>TRIGger:{A B}:LOGIc:DELTaTime?                                                                                                                         |
| <b>Arguments</b> | <NR3> the Logic trigger delta time value.                                                                                                                                                     |
| <b>Examples</b>  | TRIGger:A:LOGIc:DELTaTime 4.5e-9 sets the delta time to 4.5 ns.<br><br>TRIGger:A:LOGIc:DELTaTime? might return<br>:TRIGGER:A:LOGIC:DELTATIME 4.0E-9 indicating the delta time is set to 4 ns. |

## TRIGger:{A|B}:LOGIc:FUNCTion

This command sets or queries the logical combination of the input channels for logic triggers. This command is equivalent to selecting Logic for the Trigger Type, and setting or viewing the Define Logic.

|                  |                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                  |
| <b>Syntax</b>    | TRIGger:{A B}:LOGIc:FUNCTion {AND NANd NOR OR}<br>TRIGger:{A B}:LOGIc:FUNCTion?                                                                                                                                                                          |
| <b>Arguments</b> | AND specifies to trigger if all conditions are true.<br><br>NANd specifies to trigger if any of the conditions are false.<br><br>NOR specifies to trigger if all conditions are false.<br><br>OR specifies to trigger if any of the conditions are true. |
| <b>Examples</b>  | TRIGGER:A:LOGIC:FUNCTION AND sets the logical combination of channels to be true when all conditions are true.                                                                                                                                           |

TRIGGER:A:LOGIC:FUNCTION? might return :TRIGGER:A:LOGIC:FUNCTION NAND, indicating that the instrument will trigger if the AND logic conditions are false.

## TRIGger:{A|B}:LOGIc:INPut:CLOCK:SOURce

This command specifies the channel to use as the clock source for logic trigger.

|                  |                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                   |
| <b>Syntax</b>    | TRIGger:{A B}:LOGIc:INPut:CLOCK:SOURce {CH<x> CH<x>_D<x>}<br>TRIGger:{A B}:LOGIc:INPut:CLOCK:SOURce?                                                                                                                                      |
| <b>Arguments</b> | CH<x> specifies an analog channel as the clock source. Number of channels depends on instrument configuration.<br><br>CH<x>_D<x> specifies a digital channel as the clock source. Number of channels depends on instrument configuration. |
| <b>Examples</b>  | TRIGger:A:LOGIc:INPut:CLOCK:SOURce CH3 sets the clock source to channel 3.<br><br>TRIGger:A:LOGIc:INPut:CLOCK:SOURce? might return TRIGGER:A:LOGIC:INPUT:CLOCK:SOURCE CH3 indicating the clock source is set to channel 3.                |

## TRIGger:{A|B}:LOGIc:POLArity

This command sets or queries the polarity for the clock channel when Use Clock Edge is set to Yes for Logic trigger type.

|                  |                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                     |
| <b>Syntax</b>    | TRIGger:{A B}:LOGIc:POLArity {POSitive NEGative EITHer}<br>TRIGger:{A B}:LOGIc:POLArity?                                    |
| <b>Arguments</b> | NEGative specifies negative polarity.<br><br>POSitive specifies positive polarity.<br><br>EITHer specifies either polarity. |

**Examples** TRIGger:A:LOGIC:POLarity EITHER sets the polarity to either positive or negative.

TRIGger:A:LOGIC:POLarity? might return :TRIGGER:A:LOGIC:POLARITY POSITIVE indicating the polarity is set to positive.

## TRIGger:{A|B}:LOGic:USECLockedge

This command specifies whether or not Logic trigger type uses clock source.

**Group** Trigger

**Syntax** TRIGger:{A|B}:LOGic:USECLockedge {OFF|ON|0|1}  
TRIGger:{A|B}:LOGic:USECLockedge?

**Arguments** ON specifies that logic trigger type uses clock source.

OFF specifies that logic trigger type does not use clock source.

0 specifies that logic trigger type does not use clock source; any other number value uses clock source.

1 specifies that logic trigger type uses clock source.

**Examples** TRIGger:A:LOGic:USECLockedge OFF specifies that the clock edge will not be used.

TRIGger:A:LOGic:USECLockedge? might return :TRIGGER:A:LOGIC:USECLOCKEDGE 1 indicating that the clock edge will be used.

## TRIGger:{A|B}:LOGic:WHEn

This command sets or queries the condition for generating an A or B logic trigger with respect to the defined input pattern. This command is equivalent to selecting Logic for Trigger Type, Use Clock Edge to No, and choosing a trigger condition from the Logic Pattern drop-down list.

**Group** Trigger

**Syntax** TRIGger:{A|B}:LOGic:WHEn  
{TRUE|FALSE|MOREthan|LESSThan|EQua1| UNEQua1}  
TRIGger:{A|B}:LOGic:WHEn?

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p>TRUE triggers on an input pattern that is true.</p> <p>FALSE triggers on an input pattern that is false.</p> <p>MOREthan triggers on an input pattern that is true for a time period greater than a user defined Time Limit (DELTatime) value.</p> <p>LESSthan triggers on an input pattern that is true for a time period less than a user defined Time Limit (DELTatime) value.</p> <p>Equal triggers on an input pattern that is true for a time period equal to a user defined Time Limit (DELTatime) value.</p> <p>UNEQUAL triggers on an input pattern that is true for a time period not equal to a user defined Time Limit (DELTatime) value.</p> |
| <b>Examples</b>  | <p>TRIGger:A:LOGIC:WHEN Equal specifies triggering when the input pattern is true for a time period equal to a user defined Time Limit value.</p> <p>TRIGger:A:LOGIC:WHEN? might return :TRIGGER:A:LOGIC:WHEN TRUE indicating a trigger when the logic is true.</p>                                                                                                                                                                                                                                                                                                                                                                                          |

## TRIGger:{A|B}:LOGICPattern:{CH<x>|CH<x>\_D<x>}

This command sets or queries the Logic Pattern that is used along with the Define Logic choice (LOGIC:FUNCTION) to determine when the logic trigger occurs.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Syntax</b>    | <p>TRIGger:{A B}:LOGICPattern:{CH&lt;x&gt; CH&lt;x&gt;_D&lt;x&gt;} {HIGH LOW X}</p> <p>TRIGger:{A B}:LOGICPattern:{CH&lt;x&gt; CH&lt;x&gt;_D&lt;x&gt;}?</p>                                                                                                                                                                                                                                    |
| <b>Arguments</b> | <p>HIGH specifies the logic high.</p> <p>LOW specifies the logic low.</p> <p>X specifies a don't care state.</p>                                                                                                                                                                                                                                                                               |
| <b>Examples</b>  | <p>TRIGger:A:LOGICPattern:CH1 HIGH specifies triggering on a logic high.</p> <p>TRIGger:A:LOGICPattern:CH1? might return<br/>:TRIGGER:A:LOGICPATTERN:CH1 X indicating a don't care state for channel 1.</p> <p>TRIGger:A:LOGICPattern:CH1_D0 HIGH specifies a logic high.</p> <p>TRIGger:A:LOGICPattern:CH1_D0? might return<br/>:TRIGGER:A:LOGICPATTERN:CH1_D0 X indicating a don't care.</p> |

## TRIGger:{A|B}:LOWerthreshold:CH<x>

This command sets or queries the A or B lower trigger level threshold for the channel, specified by x.

**Group** Trigger

**Syntax** TRIGger:{A|B}:LOWerthreshold:CH<x> <NR3>  
TRIGger:{A|B}:LOWerthreshold:CH<x>?

**Related Commands** [TRIGger:{A|B}:UPPerthreshold:CH<x>](#)

**Arguments** <NR3> specifies the threshold voltage in user units.

**Examples** TRIGGER:A:LOWERTHRESHOLD:CH2 1.3 sets the A trigger threshold voltage for Channel 2 to 1.3 V.  
  
TRIGGER:A:LOWERTHRESHOLD:CH3? might return  
TRIGGER:A:LOWERTHRESHOLD:CH3 1.2000E+00, indicating that the A trigger threshold voltage for Channel 3 is 1.2 V.

## TRIGger:{A|B}:PULSEwidth:HIGHLimit

This command specifies the upper limit to use, in seconds, when triggering on detection of a pulse whose duration is inside or outside a range of two values. (Use [TRIGger:{A|B}:PULSEwidth:LOWLimit](#) to specify the lower value of the range.)

**Group** Trigger

**Syntax** TRIGger:{A|B}:PULSEwidth:HIGHLimit <NR3>  
TRIGger:{A|B}:PULSEwidth:HIGHLimit?

**Related Commands** [TRIGger:{A|B}:PULSEwidth:WHEn](#)  
[TRIGger:{A|B}:PULSEwidth:LOWLimit](#)

**Arguments** <NR3> is a floating point number that represents the higher value of the range.

**Examples** TRIGger:A:PULSEwidth:HIGHLimit 110.0E-9 sets the high limit to 110.0 ns.

TRIGger:A:PULSEwidth:HIGHLimit? might return  
TRIGGER:A:PULSEWIDTH:HIGHLIMIT 178.88000E-9 indicates the high limit is set to 178.88 ns.

## TRIGger:{A|B}:PULSEwidth:LOGICQUALification

This command specifies whether or not to use logic qualification for a pulse width trigger.

**Group** Trigger

**Syntax** TRIGger:{A|B}:PULSEwidth:LOGICQUALification {ON|OFF}  
TRIGger:{A|B}:PULSEwidth:LOGICQUALification?

**Arguments** ON specifies that the pulse width trigger type uses logic qualification.  
OFF specifies that the pulse width trigger type does not use logic qualification.

**Examples** TRIGger:A:PULSEwidth:LOGICQUALification ON turns on logic qualification.

TRIGger:A:PULSEwidth:LOGICQUALification? might return  
TRIGGER:A:PULSEWIDTH:LOGICQUALIFICATION OFF indicating logic qualification is off.

## TRIGger:{A|B}:PULSEwidth:LOWLimit

This command specifies the lower limit to use, in seconds, when triggering on detection of a pulse whose duration is inside or outside a range of two values. (Use [TRIGger:{A|B}:PULSEwidth:HIGHLimit](#) to specify the upper limit of the range.)

This command also specifies the single limit to use, in seconds, when triggering on detection of a pulse whose duration is less than, greater than, equal to, or not equal to this time limit.

**Group** Trigger

**Syntax** TRIGger:{A|B}:PULSEwidth:LOWLimit <NR3>  
TRIGger:{A|B}:PULSEwidth:LOWLimit?

**Related Commands** [TRIGger:{A|B}:PULSEWidth:WHEn](#)

[TRIGger:{A|B}:PULSEWidth:HIGHLimit](#)

**Arguments** <NR3> is a floating point number that represents the lower value of the range.

**Examples** `TRIGger:A:PULSEwidth:LOWLimit 100.0E-9` sets the low limit to 100.0 ns.

`TRIGger:A:PULSEwidth:HIGHLimit?` might return

`TRIGGER:A:PULSEWIDTH:LOWLIMIT 77.7600E-9` indicating the low limit is set to 77.76 ns.

## TRIGger:{A|B}:PULSEWidth:POLarity

This command specifies the polarity for a pulse width trigger.

**Group** Trigger

**Syntax** `TRIGger:{A|B}:PULSEwidth:POLarity {NEGative|POSitive}`  
`TRIGger:{A|B}:PULSEwidth:POLarity?`

**Arguments** `NEGative` specifies a negative pulse.

`POSitive` specifies a positive pulse.

**Examples** `TRIGger:A:PULSEwidth:POLarity NEGATIVE` sets the pulse polarity to negative.

`TRIGger:A:PULSEwidth:POLarity?` might return

`TRIGGER:A:WIDTH:POLARITY POSITIVE` indicating a positive pulse.

## TRIGger:{A|B}:PULSEWidth:SOURce

This command specifies the source waveform for a pulse width trigger.

**Group** Trigger

**Syntax** `TRIGger:{A|B}:PULSEwidth:SOURce {CH<x>|CH<x>_D<x>}`

`TRIGger:{A|B}:PULSEwidth:SOURce?`

|                  |                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | CH<x> specifies an analog input channel as the pulse-width trigger source.<br>CH<x>_D<x> specifies an digital input channel as the pulse-width trigger source.                                                              |
| <b>Examples</b>  | TRIGGER:A:PULSEWIDTH:SOURCE CH1 sets channel 1 as the pulse width source.<br><br>TRIGGER:A:PULSEWIDTH:SOURCE? might return<br>:TRIGGER:A:PULSEWIDTH:SOURCE CH1 indicating that channel 1 is the pulse width trigger source. |

## TRIGger:{A|B}:PULSEWidth:WHEn

This command specifies to trigger when a pulse is detected with a width (duration) that is less than, greater than, equal to, or unequal to a specified value (set using [TRIGger:{A|B}:PULSEWidth:LOWLimit](#)), OR whose width falls outside of or within a specified range of two values (set using [TRIGger:{A|B}:PULSEWidth:LOWLimit](#) and [TRIGger:{A|B}:PULSEWidth:HIGHLimit](#)).

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Arguments</b>        | LESSthan causes a trigger when a pulse is detected with a width less than the time set by the <a href="#">TRIGger:{A B}:PULSEWidth:LOWLimit</a> command.<br><br>MOREthan causes a trigger when a pulse is detected with a width greater than the time set by the <a href="#">TRIGger:{A B}:PULSEWidth:LOWLimit</a> command.<br><br>EQUAL causes a trigger when a pulse is detected with a width equal to the time period specified in <a href="#">TRIGger:{A B}:PULSEWidth:LOWLimit</a> within a $\pm 5\%$ tolerance.<br><br>UNEQUAL causes a trigger when a pulse is detected with a width greater than or less than (but not equal) the time period specified in <a href="#">TRIGger:{A B}:PULSEWidth:LOWLimit</a> within a $\pm 5\%$ tolerance. |

WITHin causes a trigger when a pulse is detected that is within a range set by two values.

OUTside causes a trigger when a pulse is detected that is outside of a range set by two values.

**Examples**     :TRIGger:B:PULSEwidth:WHEN LESSthan causes the instrument to trigger when a pulse is detected that is shorter than the time specified by [TRIGger:{A|B}:PULSEWidth:LOWLimit](#).

TRIGger:A:PULSEwidth:WHEN ? might return  
TRIGGER:A:PULSEWIDTH:WHEN GREATER THAN 2.0000E-9, indicating that a trigger is generated when a pulse is detected greater than 2 ns.

TRIGger:B:PULSEwidth:WHEN? might return  
TRIGGER:B:PULSEWIDTH:WHEN MOREthan indicating that a trigger is generated when a pulse is detected that is greater than the time specified by [TRIGger:{A|B}:PULSEWidth:LOWLimit](#).

## TRIGger:{A|B}:RUNT:LOGICQUALification

This command specifies whether or not to use logic qualification for a runt trigger.

**Group**     Trigger

**Syntax**     TRIGger:{A|B}:RUNT:LOGICQUALification {ON|OFF}  
TRIGger:{A|B}:RUNT:LOGICQUALification?

**Arguments**   ON specifies that the runt trigger type uses logic qualification.  
OFF specifies that the runt trigger type does not use logic qualification.

**Examples**     TRIGger:A:RUNT:LOGICQUALification ON turns on logic qualification.  
TRIGger:A:RUNT:LOGICQUALification? might return  
:TRIGGER:A:RUNT:LOGICQUALIFICATION OFF indicating logic qualification is off.

## TRIGger:{A|B}:RUNT:POLarity

This command specifies the polarity for the runt trigger.

**Group**     Trigger

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>    | <pre>TRIGger:{A B}:RUNT:POLArity {EITHer NEGAtive POSitive} TRIGger:{A B}:RUNT:POLArity?</pre>                                                                                                                                                                                                                                                                                                                        |
| <b>Arguments</b> | <p>POSitive indicates that the rising edge crosses the low threshold and the falling edge recrosses the low threshold without either edge ever crossing the high threshold.</p> <p>NEGAtive indicates that the falling edge crosses the high threshold and the rising edge recrosses the high threshold without either edge ever crossing the low threshold.</p> <p>EITHer triggers on a runt of either polarity.</p> |
| <b>Examples</b>  | <p>TRIGger:A:RUNT:POLArity NEGATIVE specifies that the polarity of the A pulse runt trigger is negative.</p> <p>TRIGger:A:RUNT:POLArity? might return :TRIGGER:A:RUNT:POLARITY POSITIVE indicating that the polarity of the A pulse runt trigger is positive.</p>                                                                                                                                                     |

## TRIGger:{A|B}:RUNT:SOURce

This command specifies the source waveform for the runt trigger.

---

**NOTE.** *Digital channels are not supported as runt trigger sources.*

---

|                  |                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                                     |
| <b>Syntax</b>    | <pre>TRIGger:{A B}:RUNT:SOURce {CH&lt;x&gt;} TRIGger:{A B}:RUNT:SOURce?</pre>                                                                                                                                                                                                                               |
| <b>Arguments</b> | <p>CH&lt;x&gt; specifies the analog channel number to use as the source waveform for the runt trigger. To specify the threshold levels when using CH&lt;x&gt; as the source, use <a href="#">TRIGger:{A B}:LOWerthreshold:CH&lt;x&gt;</a> and <a href="#">TRIGger:{A B}:UPPerthreshold:CH&lt;x&gt;</a>.</p> |
| <b>Examples</b>  | <p>TRIGger:A:RUNT:SOURce CH4 sets channel 4 as the trigger source.</p> <p>TRIGger:A:RUNT:SOURce? might return :TRIGGER:A:RUNT:SOURCE CH2 indicating that channel 2 is the trigger source.</p>                                                                                                               |

## TRIGger:{A|B}:RUNT:WHEn

This command specifies the type of pulse width the trigger checks for when it detects a runt.

**Group** Trigger

**Syntax** TRIGger:{A|B}:RUNT:WHEn  
{LESSthan|MOREthan|EQua|UNEQua|OCCURS}  
TRIGger:{A|B}:RUNT:WHEn?

**Related Commands** [TRIGger:{A|B}:RUNT:WIDth](#)

**Arguments** OCCURS sets the instrument to trigger if a runt signal of any detectable width occurs.

LESSthan sets the instrument to trigger if the a runt pulse is detected with width less than the time set by the [TRIGger:{A|B}:RUNT:WIDth](#) command.

MOREthan sets the instrument to trigger if the a runt pulse is detected with width greater than the time set by the [TRIGger:{A|B}:RUNT:WIDth](#) command.

EQua sets the instrument to trigger if a runt pulse is detected with width equal to the time period specified in [TRIGger:{A|B}:RUNT:WIDth](#) within a  $\pm 5\%$  tolerance.

UNEQua sets the instrument to trigger if a runt pulse is detected with width greater than or less than (but not equal to) the time period specified in [TRIGger:{A|B}:RUNT:WIDth](#) within a  $\pm 5\%$  tolerance.

**Examples** TRIGger:A:RUNT:WHEn MORETHAN sets the runt trigger to occur when the instrument detects a runt in a pulse wider than the specified width.

TRIGger:A:RUNT:WHEn? might return :TRIGGER:A:PULSE:RUNT:WHEn OCCURS indicating that a runt trigger will occur if the instrument detects a runt of any detectable width.

## TRIGger:{A|B}:RUNT:WIDth

This command specifies the width, in seconds, for a runt trigger.

**Group** Trigger

**Syntax** TRIGger:{A|B}:RUNT:WIDth <NR3>  
TRIGger:{A|B}:RUNT:WIDth?

**Related Commands** TRIGger:{A|B}:RUNT:WHEn

**Arguments** <NR3> is a floating point number that specifies the minimum width, in seconds.

**Examples** TRIGger:A:RUNT:WIDth 15E-6 sets the minimum width of the pulse runt trigger to 15  $\mu$ s.  
TRIGger:A:RUNT:WIDth? might return :TRIGGER:A:PULSE:RUNT:WIDTH 2.0000E-09 indicating that the minimum width of a pulse runt trigger is 2 ns.

## TRIGger:{A|B}:SETHold:CLOCK:EDGE

This command specifies the clock edge polarity for setup and hold triggering.

**Group** Trigger

**Syntax** TRIGger:{A|B}:SETHold:CLOCK:EDGE {FALL|RISE}  
TRIGger:{A|B}:SETHold:CLOCK:EDGE?

**Arguments** FALL specifies polarity as the clock falling edge.  
RISE specifies polarity as the clock rising edge.

**Examples** TRIGger:A:SETHold:CLOCK:EDGE RISE specifies the polarity as the clock rising edge.  
TRIGger:A:SETHold:CLOCK:EDGE? might return :TRIGGER:A:SETHOLD:CLOCK:EDGE RISE indicating that polarity is specified as the clock rising edge.

## TRIGger:{A|B}:SETHold:CLOCK:SOUrce

This command specifies the clock source for the setup and hold triggering. You cannot specify the same source for both clock and data.

**Group** Trigger

**Syntax** TRIGger:{A|B}:SETHold:CLOCK:SOURce {CH<x>|CH<x>\_D<x>}  
 TRIGger:{A|B}:SETHold:CLOCK:SOURce?

**Arguments** CH<x> specifies the analog channel to use as the clock source waveform.  
 CH<x>\_D<x> specifies the digital channel to use as the clock source waveform.

**Examples** TRIGger:A:SETHold:CLOCK:SOURce CH1 specifies channel 1 as the clock source for a setup and hold trigger operation.  
 TRIGger:A:SETHold:CLOCK:SOURce? might return  
 :TRIGGER:A:SETHOLD:CLOCK:SOURCE CH4 indicating that channel 4 is the clock source for a setup and hold trigger operation.

## TRIGger:{A|B}:SETHold:HOLDTime

This command specifies the hold time for setup and hold violation triggering. This command is equivalent to selecting Setup/Hold Setup from the Trig menu and then setting the desired Hold Time.

**Group** Trigger

**Syntax** TRIGger:{A|B}:SETHold:HOLDTime <NR3>  
 TRIGger:{A|B}:SETHold:HOLDTime?

**Arguments** <NR3> is a floating point number that specifies the hold time setting, in seconds. Positive values for hold time occur after the clock edge. Negative values occur before the clock edge.

**Examples** TRIGger:A:SETHold:HOLDTime 3.0E-3 sets the hold time for the setup and hold trigger to 3 ms.  
 TRIGger:A:SETHold:HOLDTime? might return  
 :TRIGGER:A:SETHOLD:HOLDTIME 2.0000E-09 indicating that the current hold time for the setup and hold trigger is 2 ns.

## TRIGger:{A|B}:SETHold:SETTime

This command specifies the setup time for setup and hold violation triggering. This command is equivalent to selecting Setup/Hold Setup from the Trig menu and then setting the desired Setup Time.

| <b>Arguments</b> | <NR3> is a floating point number that specifies the setup time for setup and hold violation triggering.                                                                                                                                                                                                    |
| <b>Examples</b>  | <p>TRIGger:A:SETHold:SETTime 3.0E-6 specifies that the current setup time for setup and hold trigger is 3 <math>\mu</math>s.</p> <p>TRIGger:A:SETHold:SETTime? might return<br/>:TRIGGER:A:LOGIC:SETHOLD:SETTIME 2.0000E-09 indicating that the current setup time for setup and hold trigger is 2 ns.</p> |

## TRIGger:{A|B}:SETHOLDLogicval:{CH<x>|CH<x>\_D<x>}

This command sets or queries whether the specified channel is included (INCLude) or not included (DONTInCLude) in the Setup & Hold trigger input configuration. The channel number is specified by x.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

TRIGger:A:SETHOLDLogicval:CH1\_D0? might return  
:TRIGGER:A:SETHOLDLOGICVAL:CH1\_D0 DONTINCLUDE indicating  
the channel will not be included in the configuration.

## TRIGger:{A|B}:TIMEOut:LOGICQUALification

This command specifies whether or not to use logic qualification for a timeout trigger.

**Group** Trigger

**Syntax** TRIGger:{A|B}:TIMEOut:LOGICQUALification {ON|OFF}  
TRIGger:{A|B}:TIMEOut:LOGICQUALification?

**Arguments** ON specifies that the timeout trigger type uses logic qualification.  
OFF specifies that the timeout trigger type does not use logic qualification.

**Examples** TRIGger:A:TIMEOut:LOGICQUALification ON specifies using logic qualification.  
TRIGger:A:TIMEOut:LOGICQUALification? might include  
:TRIGGER:A:TIMEOUT:LOGICQUALIFICATION OFF indicating that logic qualification is off.

## TRIGger:{A|B}:TIMEOut:POLarity

When triggering using the TIMEOUT trigger type, this commands specifies the polarity to be used.

**Group** Trigger

**Syntax** TRIGger:{A|B}:TIMEOut:POLarity {STAYSHigh|STAYSLow|EITHer}  
TRIGger:{A|B}:TIMEOut:POLarity?

**Related Commands** [TRIGger:{A|B}:TIMEOut:SOUrce](#)  
[TRIGger:{A|B}:TIMEOut:TIME](#)

**Arguments** STAYSHigh triggers when the signal stays high during the timeout time specified by the command [TRIGger:{A|B}:TIMEOut:TIME](#).

STAYSLow triggers when the signal stays low during the timeout time specified by the command `TRIGger:{A|B}:TIMEOut:TIME`.

EITHer triggers when the signal is either high or low during the timeout time specified by the command `TRIGger:{A|B}:TIMEOut:TIME`.

**Examples** `TRIGger:A:TIMEOut:POLarity STAYSHigh` specifies to trigger when the signal stays high during the timeout time when triggering using the `TIMEOut` trigger type.

`TRIGger:A:TIMEOut:POLarity?` might return `EITHER`, indicating that the signal stays either high or low during the timeout time.

## TRIGger:{A|B}:TIMEOut:SOURce

When triggering using the `TIMEOut` trigger type, this command specifies the source. The available sources are live channels and digital channels. The default is channel 1. The timeout trigger type is selected using `TRIGger:{A|B}:TYPE TIMEOut`.

**Group** Trigger

**Syntax** `TRIGger:{A|B}:TIMEOut:SOURce {CH<x>|CH<x>_D<x>}`  
`TRIGger:{A|B}:TIMEOut:SOURce?`

**Related Commands** [SEARCH:SEARCH<x>:TRIGger:A:TIMEOut:SOURce](#)  
[TRIGger:{A|B}:TIMEOut:TIME](#)  
[TRIGger:{A|B}:TIMEOut:POLarity](#)

**Arguments** `CH<x>` specifies an analog channel as the timeout trigger source.  
`CH<x>_D<x>` specifies a digital channel as the timeout trigger source.

**Examples** `TRIGger:A:TIMEOut:SOURce CH4` specifies to use channel 4 as the source for the timeout trigger.

`TRIGger:A:TIMEOut:SOURce?` might return `CH1`, indicating that channel 1 has been set as the source for the timeout trigger.

## TRIGger:{A|B}:TIMEOut:TIME

When triggering using the TIMEOut trigger type, this command specifies the timeout time, in seconds. This command is equivalent to selecting Timeout from the Trig menu and setting a value for Time Limit. The timeout trigger type is selected using [TRIGger:{A|B}:TYPE](#) TIMEOut

**Group** Trigger

**Syntax** TRIGger:{A|B}:TIMEOut:TIME <NR3>  
TRIGger:{A|B}:TIMEOut:TIME?

**Related Commands** [TRIGger:{A|B}:TIMEOut:POLarity](#)  
[TRIGger:{A|B}:TIMEOut:SOUrce](#)

**Arguments** <NR3> is a floating point number that specifies the timeout time, in seconds.

**Examples** :TRIGger:A:TIMEOut:TIME 4.0E-9 specifies the timeout time of 4.0 nsec.  
:TRIGger:A:TIMEOut:TIME? might return 8.0000E-9.

## TRIGger:{A|B}:TRANSition:DELTatime

This command specifies the delta time (that is Time Limit) used in calculating the transition value for the transition (that is Rise or Fall Time) trigger.

**Group** Trigger

**Syntax** TRIGger:{A|B}:TRANSition:DELTatime <NR3>  
TRIGger:{A|B}:TRANSition:DELTatime?

**Arguments** <NR3> is a floating point number that specifies the delta time, in seconds.

**Examples** TRIGGER:A:TRANSITION:DELTATIME 15E-6 sets the delta time of the transition trigger to 15  $\mu$ s.  
TRIGGER:A:TRANSITION:DELTATIME? might return  
:TRIGGER:A:TRANSITION:DELTATIME 2.0000E-09 indicating that the delta time of the transition trigger is set to 2 ns.

## TRIGger:{A|B}:TRANSition:LOGICQUALification

This command specifies whether or not to use logic qualification for a transition trigger.

|                  |                                                                                                                                                                                                                              |

| <b>Syntax</b>    | TRIGger:{A B}:TRANSition:LOGICQUALification {ON OFF}<br>TRIGger:{A B}:TRANSition:LOGICQUALification?                                                                                                                         |
| <b>Arguments</b> | ON specifies that the transition trigger type uses logic qualification.<br>OFF specifies that the transition trigger type does not use logic qualification.                                                                  |
| <b>Examples</b>  | TRIGger:A:TRANSition:LOGICQUALification ON specifies using logic qualification.<br>TRIGger:A:TRANSition:LOGICQUALification? might return :TRIGGER:A:TRANSITION:LOGICQUALIFICATION OFF indicating logic qualification is off. |

## TRIGger:{A|B}:TRANSition:POLarity

This command specifies the polarity for the transition trigger.

|                  |                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Syntax</b>    | TRIGger:{A B}:TRANSition:POLarity {EITHer NEGative POSitive}<br>TRIGger:{A B}:TRANSition:POLarity?                                                                                                                                                                                                                                                                      |
| <b>Arguments</b> | POSitive indicates that a pulse edge must traverse from the lower (most negative) to higher (most positive) level for transition triggering to occur.<br>NEGative indicates that a pulse edge must traverse from the upper (most positive) to lower (most negative) level for transition triggering to occur.<br>EITHer indicates either positive or negative polarity. |
| <b>Examples</b>  | TRIGGER:A:TRANSITION:POLARITY NEGATIVE sets the transition polarity to negative.                                                                                                                                                                                                                                                                                        |

TRIGGER:A:TRANSITION:POLARITY? might return  
:TRIGGER:A:TRANSITION:POLARITY EITHER indicating that the polarity  
can be either positive or negative.

## TRIGger:{A|B}:TRANSition:SOUrce

This command specifies the source waveform for a transition trigger.

---

**NOTE.** *Digital channels are not supported as transition trigger sources.*

---

|                  |                                                                                                                                                                                                                                                   |

## TRIGger:{A|B}:TRANSition:WHEn

This command specifies whether to check for a transitioning signal that is faster or slower than the specified delta time.

|                  |                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                |
| <b>Syntax</b>    | TRIGger:{A B}:TRANSition:WHEn {SLOWer FASTer EQua UNEQua }<br>TRIGger:{A B}:TRANSition:WHEn?                                                                                                                                                                           |
| <b>Arguments</b> | FASTer sets the trigger to occur when the signal transition time is faster than the time set by TRIGger:A:TRANSition:DELTAtime.<br><br>SLOWer sets the trigger to occur when the signal transition time is slower than the time set by.TRIGger:A:TRANSition:DELTAtime. |

**Equal** sets the trigger to occur when the signal transition time is equal to the time set by `TRIGGER:A:TRANSITION:DELTAtime`.

**UNEQUAL** sets the trigger to occur when the signal transition time is not equal to the time set by `TRIGGER:A:TRANSITION:DELTAtime`.

**Examples** `TRIGGER:A:TRANSITION:WHEN SLOWER` sets the trigger to occur when the signal transition time is slower than the time set by the `TRIGGER:A:TRANSITION:DELTAtime` command.

`TRIGGER:A:TRANSITION:WHEN?` might return  
`:TRIGGER:A:TRANSITION:WHEN FASTER`

## TRIGGER:{A|B}:TYPE

This command sets or queries the type of A or B trigger.

**Group** Trigger

**Syntax** `TRIGGER:{A|B}:TYPE {EDGE|WIDTH|TIMEOUT|RUNT|WINDOW|LOGIC|SETHOLD|TRANSITION|BUS}`  
`TRIGGER:{A|B}:TYPE?`

**Arguments** **EDGE** is a normal trigger. A trigger event occurs when a signal passes through a specified voltage level in a specified direction and is controlled by the `TRIGGER:A:EDGE` commands.

**WIDTH** specifies that the trigger occurs when a pulse with a specified width is found.

**TIMEOUT** specifies that a trigger occurs when a pulse with the specified timeout is found.

**RUNT** specifies that a trigger occurs when a pulse with the specified parameters is found.

**WINDOW** specifies that a trigger occurs when a signal with the specified window parameters is found.

**LOGIC** specifies that a trigger occurs when specified conditions are met and is controlled by the `TRIGGER:{A|B}:LOGIC` commands.

**SETHOLD** specifies that a trigger occurs when a signal is found that meets the setup and hold parameters.

**TRANSITION** specifies that a trigger occurs when a specified pulse is found that meets the transition trigger parameters.

BUS specifies that a trigger occurs when a signal is found that meets the specified bus setup parameters.

**Examples** TRIGGER:A:TYPE EDGE sets the A trigger type to EDGE.  
TRIGGER:A:TYPE? might return :TRIGGER:A:TYPE RUNT indicating that the A trigger type is a runt trigger.

## TRIGger:{A|B}:UPPerthreshold:CH<x>

This command sets or queries the specified channel upper trigger level. The CH<x> range is 1 to 8 and depends on the number of analog channels on your instrument.

**Group** Trigger

**Syntax** TRIGger:{A|B}:UPPerthresHoId:CH<x> <NR3>  
TRIGger:{A|B}:UPPerthresHoId:CH<x>?

**Related Commands** [TRIGger:{A|B}:LOWerthreshold:CH<x>](#)

**Arguments** <NR3> specifies the trigger level in user units (usually volts).

**Examples** TRIGGER:A:UPPERTHRESHOLD:CH1 1.3 This command sets the A trigger level for Channel 1 to 1.3 V level.  
TRIGGER:A:UPPERTHRESHOLD:CH2? might return  
TRIGGER:A:UPPERTHRESHOLD:CH2 1.3000E+00, indicating that the A trigger level for Channel 2 is set to 1.3 V.

## TRIGger:{A|B}:VIDeo:FIELD

This command specifies the trigger condition for a video trigger.

**Group** Trigger

**Syntax** TRIGger:{A|B}:VIDeo:FIELD {ALLLines| NUMERic| ODD| EVEN| ALLFields}  
TRIGger:{A|B}:VIDeo:FIELD?

|                  |                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Arguments</b> | <p><code>ALLlines</code> specifies to trigger on all lines.</p> <p><code>NUMERIC</code> specifies to trigger on a particular line, which can be set via the <code>TRIGGER:{A B}:VIDEO:LINE</code> command.</p> <p><code>ODD</code> specifies to trigger on odd lines.</p> <p><code>EVEN</code> specifies to trigger on even lines.</p> <p><code>ALLfields</code> specifies to trigger on any video field.</p> |
| <b>Examples</b>  | <p><code>TRIGGER:A:VIDEO:FIELD ALLlines</code> sets the video trigger to trigger on all lines.</p> <p><code>TRIGGER:A:VIDEO:FIELD?</code> might return <code>TRIGGER:A:VIDEO:FIELD ODD</code>, indicating that the video trigger will trigger on odd lines.</p>                                                                                                                                               |

## TRIGGER:{A|B}:VIDEO:LINE

This command specifies the line number value for a video line number trigger.

|                  |                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                               |
| <b>Syntax</b>    | <p><code>TRIGGER:{A B}:VIDEO:LINE &lt;NR1&gt;</code><br/> <code>TRIGGER:{A B}:VIDEO:LINE?</code></p>                                                                                                                                                  |
| <b>Arguments</b> | <code>&lt;NR1&gt;</code> is the line number to trigger on, which can range from 1 to 625.                                                                                                                                                             |
| <b>Examples</b>  | <p><code>TRIGGER:A:VIDEO:LINE 262</code> sets the video trigger to trigger on line 262.</p> <p><code>TRIGGER:A:VIDEO:LINE?</code> might return <code>TRIGGER:A:VIDEO:LINE 525</code>, indicating that the video trigger will trigger on line 525.</p> |

## TRIGGER:{A|B}:VIDEO:POLarity

This command specifies the polarity for a video trigger.

|               |                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>  | Trigger                                                                                                              |
| <b>Syntax</b> | <p><code>TRIGGER:{A B}:VIDEO:POLarity {POSitive NEGative}</code><br/> <code>TRIGGER:{A B}:VIDEO:POLarity?</code></p> |

- Arguments** POSitive specifies a positive polarity for the video trigger.  
NEGative specifies a negative polarity for the video trigger.
- Examples** TRIGger:A:VIDeo:POLarity POSitive specifies to use a positive polarity for the video trigger.  
TRIGger:A:VIDeo:POLarity? might return TRIGGER:A:VIDeo:POLarity NEGative, indicating that the video trigger has a negative polarity.

## TRIGger:{A|B}:VIDeo:SOURce

This command specifies the source waveform for a video trigger.

- Group** Trigger
- Syntax** TRIGger:{A|B}:VIDeo:SOURce {CH<x>}  
TRIGger:{A|B}:VIDeo:SOURce?
- Arguments** CH<x> specifies the analog channel to use as the video trigger source waveform.
- Examples** TRIGger:A:VIDeo:SOURce CH2 sets channel 2 as the source waveform for the video trigger.  
TRIGger:A:VIDeo:SOURce? might return TRIGGER:A:VIDeo:SOURce CH1, indicating that CH1 is the source waveform for the video trigger.

## TRIGger:{A|B}:VIDeo:STANdard

This command specifies the standard/format for a video trigger.

- Group** Trigger
- Syntax** TRIGger:{A|B}:VIDeo:STANdard {NTSc|PAL|SECAM}  
TRIGger:{A|B}:VIDeo:STANdard?
- Arguments** NTSC specifies 525i/NTSC as the video standard.  
PAL specifies 625i/PAL as the video standard.  
SECAM specifies SECAM as the video standard.

- Examples**    `TRIGger:A:VIDeo:STANdard PAL` sets 625i/PAL as the video standard to use for the video trigger.
- `TRIGger:A:VIDeo:STANdard?` might return `TRIGGER:A:VIDeo:STANdard NTSc`, indicating that 525i/NTSC is the video standard being used for the video trigger.

## TRIGger:{A|B}:WINDow:CROSSIng

This command sets or queries the window trigger threshold crossing of the selected trigger source. The threshold crossing selection is only effective when `:TRIGger:{A|B}:WINDow:WHEN` is `INSIDEGreater` or `OUTSIDEGreater`.

**Group**    Trigger

**Syntax**    `TRIGger:{A|B}:WINDow:CROSSIng {UPPer|LOWer|EITHer|NONE}`  
`TRIGger:{A|B}:WINDow:CROSSIng?`

- Arguments**    `UPPer` if `:TRIGger:{A|B}:WINDow:WHEN` is `INSIDEGreater`, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then exits through the upper threshold. If `:TRIGger:{A|B}:WINDow:WHEN` is `OUTSIDEGreater`, the instrument triggers when the signal remains above the upper threshold for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then crosses downward through the upper threshold.
- `LOWer` if `:TRIGger:{A|B}:WINDow:WHEN` is `INSIDEGreater`, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then exits through the lower threshold. If `:TRIGger:{A|B}:WINDow:WHEN` is `OUTSIDEGreater`, the instrument triggers when the signal remains below the lower threshold for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then crosses upwards through the lower threshold.
- `EITHer` if `:TRIGger:{A|B}:WINDow:WHEN` is `INSIDEGreater`, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then exits through either the upper or lower threshold. If `:TRIGger:{A|B}:WINDow:WHEN` is `OUTSIDEGreater`, the instrument triggers when the signal remains either above the upper threshold or below the lower threshold for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) and then crosses a threshold.
- `NONE` if `:TRIGger:{A|B}:WINDow:WHEN` is `INSIDEGreater`, the instrument triggers when the signal remains between the upper and lower thresholds for longer than the time limit (`:TRIGger:{A|B}:WINDow:WIDTH`) without crossing through either the upper or lower threshold. If `:TRIGger:{A|B}:WINDow:WHEN`

is OUTSIDEGreater, the instrument triggers when the signal remains outside the upper and lower thresholds for longer than the time limit (:TRIGGER:{A|B}:WINDOW:WIDTH) without crossing through either the upper or lower threshold.

**Examples** TRIGGER:A:WINDOW:CROSSING LOWER sets crossing to lower.  
TRIGGER:A:WINDOW:CROSSING? might return  
TRIGGER:A:WINDOW:CROSSING UPPER indicating the crossing is set to upper.

## TRIGGER:{A|B}:WINDOW:LOGICQUALIFICATION

This command specifies whether or not to use logic qualification for a window trigger.

**Group** Trigger

**Syntax** TRIGGER:{A|B}:WINDOW:LOGICQUALIFICATION {ON|OFF}  
TRIGGER:{A|B}:WINDOW:LOGICQUALIFICATION?

**Arguments** ON specifies that the window trigger type uses logic qualification.  
OFF specifies that the window trigger type does not use logic qualification.

**Examples** TRIGGER:A:WINDOW:LOGICQUALIFICATION ON turns on logic qualification.  
TRIGGER:A:WINDOW:LOGICQUALIFICATION? might return  
TRIGGER:A:WINDOW:LOGICQUALIFICATION OFF indicating logic qualification is off.

## TRIGGER:{A|B}:WINDOW:SOURCE

This command sets or queries the source for a window trigger.

---

**NOTE.** *Digital channels are not supported as window trigger sources.*

---

**Group** Trigger

**Syntax** TRIGGER:{A|B}:WINDOW:SOURCE {CH<x>}  
TRIGGER:{A|B}:WINDOW:SOURCE?

**Arguments** CH<x> specifies an analog channel as the trigger source.

**Examples** TRIGger:A:WINDOW:SOURCE CH2 sets the source to channel 2.  
 TRIGger:A:WINDOW:SOURCE? might return :TRIGGER:A:WINDOW:SOURCE  
 CH3 indicating the source is channel 3.

## TRIGger:{A|B}:WINDOW:WHEN

This command sets or queries the window trigger event. This command is equivalent to selecting Window Setup from the Trig menu and selecting from the Window Trigger When box.

**Group** Trigger

**Syntax** TRIGger:{A|B}:WINDOW:WHEN {ENTERSWINDOW|EXITSWINDOW|  
 INSIDEGREATER|OUTSIDEGREATER}  
 TRIGger:{A|B}:WINDOW:WHEN?

**Arguments** OUTSIDEGREATER specifies a trigger event when the signal leaves the window defined by the threshold levels for the time specified by Width.  
 INSIDEGREATER specifies a trigger event when the signal enters the window defined by the threshold levels for the time specified by Width.  
 ENTERSWINDOW specifies a trigger event when the signal enters the window defined by the threshold levels.  
 EXITSWINDOW specifies a trigger event when the signal leaves the window defined by the threshold levels.

**Examples** TRIGger:A:WINDOW:WHEN EXITSWINDOW specifies a trigger event when the signal leaves the window defined by the threshold levels.  
 TRIGger:A:WINDOW:WHEN? might return :TRIGGER:A:WINDOW:WHEN  
 ENTERSWINDOW indicating a trigger when the signal enters the window.

## TRIGger:{A|B}:WINDOW:WIDTH

This command sets or queries the minimum width for a window violation. This command is equivalent to selecting Window Setup from the Trig menu, selecting Inside > Limit or Outside > Limit in the Trigger When box, and setting the Time Limit.

|                  |                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                               |
| <b>Syntax</b>    | TRIGger:{A B}:WINDow:WIDTh <NR3><br>TRIGger:{A B}:WINDow:WIDTh?                                                                                                                                                                       |
| <b>Arguments</b> | <NR3> is the minimum width for a window violation.                                                                                                                                                                                    |
| <b>Examples</b>  | TRIGger:A:WINDow:WIDTh 4.5e-9 sets the minimum width for a window violation to 4.5 ns.<br><br>TRIGger:A:WINDow:WIDTh? might return :TRIGGER:A:WINDOW:WIDTH 4.0E-9 indicating that 4.0 ns is the minimum width for a window violation. |

## TRIGger:A:HOLDoff:BY

This command sets or queries the type of holdoff for the A trigger. Holdoff types are expressed as either user-specified time (TIME) or by an internally calculated random time value (RANDOM). This command is equivalent to selecting Mode & Holdoff from the Trig menu and then setting the Holdoff type.

|                         |                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>            | Trigger                                                                                                                                                                                                                             |
| <b>Syntax</b>           | TRIGger:A:HOLDoff:BY {TIME RANDOM}<br>TRIGger:A:HOLDoff:BY?                                                                                                                                                                         |
| <b>Related Commands</b> | <a href="#">TRIGger:A:HOLDoff:TIME</a>                                                                                                                                                                                              |
| <b>Arguments</b>        | TIME enables you to set the holdoff time via the <a href="#">TRIGger:A:HOLDoff:TIME</a> command.<br><br>RANDOM specifies a random time value.                                                                                       |
| <b>Examples</b>         | TRIGGER:A:HOLDOFF:BY TIME sets the holdoff to the "by time" setting. This enables you to set the holdoff time.<br><br>TRIGGER:A:HOLDOFF:BY? might return :TRIGGER:A:HOLDOFF:BY TIME, indicating that you will set the holdoff time. |

## TRIGger:A:HOLDoff:TIME

This command sets or queries the A trigger holdoff time. This command is equivalent to selecting Mode & Holdoff from the Trig menu, selecting Time, and then setting the desired Holdoff Time.

**Group** Trigger

**Syntax** TRIGger:A:HOLDoff:TIME <NR3>  
TRIGger:A:HOLDoff:TIME?

**Related Commands** [TRIGger:A:HOLDoff:BY](#)

**Arguments** <NR3> specifies the holdoff time in seconds. The range is from 0 seconds through 10 seconds.

**Examples** TRIGGER:A:HOLDOFF:TIME 10 sets the A trigger holdoff time to 10 s.  
TRIGGER:A:HOLDOFF:TIME? might return :TRIGGER:A:HOLDOFFTIME  
1.2000E-06, indicating that the A trigger holdoff time is set to 1.2  $\mu$ s.

## TRIGger:A:LOGICQUALification

This command sets or queries the type of logic qualification to perform.

**Group** Trigger

**Syntax** TRIGger:A:LOGICQUALification {AND|OR|NAND|NOR}  
TRIGger:A:LOGICQUALification?

**Arguments** AND specifies to trigger if all conditions are true.  
NAND specifies to trigger if any of the conditions are false.  
NOR specifies to trigger if all conditions are false.  
OR specifies to trigger if any of the conditions are true.

**Examples** TRIGGER:A:LOGICQUALIFICATION OR specifies to trigger if any of the conditions are true.

TRIGGER:A:LOGICQUALIFICATION? might return  
TRIGGER:A:LOGICQUALIFICATION AND indicating the instrument will trigger  
if all conditions are true.

## TRIGger:A:MODE

This command sets or queries the A trigger mode. This command is equivalent to pushing the Mode button on the front panel.

|                  |                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                               |
| <b>Syntax</b>    | TRIGger:A:MODE {AUTO NORMa1}<br>TRIGger:A:MODE?                                                                                                       |
| <b>Arguments</b> | AUTO generates a trigger if one is not detected within a specified time period.<br>NORMa1 waits for a valid trigger event.                            |
| <b>Examples</b>  | TRIGGER:A:MODE NORMAL sets the trigger mode to normal.<br>TRIGGER:A:MODE? might return TRIGGER:A:MODE AUTO, indicating that the trigger mode is auto. |

## TRIGger:AUXLevel

For those instruments that have an Auxiliary Input (such as an MSO58LP), this command sets or queries the Auxiliary Input voltage level to use for an edge trigger.

|                  |                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                           |
| <b>Syntax</b>    | TRIGger:AUXLeve1 {<NR3> ECL TTL}<br>TRIGger:AUXLeve1?                                                             |
| <b>Arguments</b> | <NR3> is trigger level in Volts.<br>ECL sets trigger level to -1.3 Volts.<br>TTL sets trigger level to 1.4 Volts. |
| <b>Returns</b>   | <NR3> is trigger level in Volts.                                                                                  |

**Examples** TRIGger:AUXLevel 1.2 sets trigger level for the Auxiliary Input to 1.2 Volts.

## TRIGger:B:BY

This command selects or returns whether the B trigger occurs after a specified number of events or a specified period of time after the A trigger.

**Group** Trigger

**Syntax** TRIGger:B:BY {EVENTS|TIME}  
TRIGger:B:BY?

**Related Commands** [TRIGger:B:EVENTS:COUNT](#)  
[TRIGger:B:TIME](#)  
[TRIGger:B:STATE](#)

**Arguments** EVENTS sets the B trigger to take place following a set number of trigger events after the A trigger occurs. The number of events is specified by TRIGger:B:EVENTS:COUNT.

TIME sets the B trigger to occur a set time after the A trigger event. The time period is specified by TRIGger:B:TIME.

**Examples** TRIGGER:B:BY TIME sets the B trigger to occur at a set time after the A trigger event.

TRIGGER:B:BY? might return TRIGGER:B:BY EVENTS, indicating that the B trigger takes place following a set number of trigger events after the A trigger occurs.

## TRIGger:B:EVENTS:COUNT

This command sets or queries the number of events that must occur before the B trigger. The B trigger event count applies only if TRIGger:B:BY is set to EVENTS.

**Group** Trigger

**Syntax** TRIGger:B:EVENTS:COUNT <NR1>  
TRIGger:B:EVENTS:COUNT?

**Related Commands**    [TRIGger:B:STATE](#)

**Arguments**    <NR1> is the number of B trigger events, which can range from 1 to 65,471.

**Examples**    TRIGGER:B:EVENTS:COUNT 4 sets the number of B trigger events to four.  
TRIGGER:B:EVENTS:COUNT? might return TRIGGER:B:EVENTS:COUNT 2, indicating that two events must occur after the A trigger before the B trigger can occur.

## TRIGger:B:RESET (No Query Form)

This command sets the B reset trigger level to 50%.

**Group**    Trigger

**Syntax**    TRIGger:B:RESET SETLeve1

**Arguments**    SETLeve1 sets the B reset trigger level to 50%.

**Examples**    TRIGger:B:RESET SETLeve1 sets the B reset trigger level to 50%.

## TRIGger:B:RESET:EDGE:COUPling

Sets or queries the trigger coupling for a sequential edge trigger reset when the Source is set to an analog channel.

**Group**    Trigger

**Syntax**    TRIGger:B:RESET:EDGE:COUPling {DC|HFRej|LFRej|NOISerej}  
TRIGger:B:RESET:EDGE:COUPling?

**Related Commands**

**Arguments**    DC selects DC trigger coupling.  
HFRej selects high frequency low sensitivity.  
LFRej selects low frequency low sensitivity.  
NOISerej selects DC low sensitivity.

**Examples** TRIGGER:B:RESET:EDGE:COUPLING HFREJ sets high frequency low sensitivity.

TRIGGER:B:RESET:EDGE:COUPLING? might return  
TRIGGER:B:RESET:EDGE:COUPLING DC indicating DC trigger coupling is selected.

## TRIGger:B:RESET:EDGE:LEVEL

This command sets the voltage level to use for an Edge Reset trigger when triggering on an analog channel waveform.

**Group** Trigger

**Syntax** TRIGger:B:RESET:EDGE:LEVEL <NR3>

**Arguments** <NR3> is the voltage level to use for an Edge Reset trigger when triggering on an analog channel waveform.

**Examples** TRIGGER:B:RESET:EDGE:LEVEL 50.0e-3 sets the level to 50.0 mV.

TRIGGER:B:RESET:EDGE:LEVEL? might return  
TRIGGER:B:RESET:EDGE:LEVEL 0.0E+0 indicating the level is set to 0.0 V.

## TRIGger:B:RESET:EDGE:SLOPE

This command sets or queries the trigger slope for a sequential edge trigger reset.

**Group** Trigger

**Syntax** TRIGger:B:RESET:EDGE:SLOPE {RISe|FALL|EITHer}  
TRIGger:B:RESET:EDGE:SLOPE?

**Arguments** RISe specifies to reset the trigger on the rising or positive edge of a signal.  
FALL specifies to reset the trigger on the falling or negative edge of a signal.  
EITHer specified to reset the trigger on either the rising or falling edge of a signal.

**Examples** TRIGGER:B:RESET:EDGE:SLOPE FALL specifies to reset the trigger on the falling or negative edge of a signal.

TRIGGER:B:RESET:EDGE:SLOPE? might return  
TRIGGER:B:RESET:EDGE:SLOPE RISE indicating the instrument is set to reset  
the trigger on the rising or positive edge of a signal.

## TRIGger:B:RESET:EDGE:SOURce

This command sets or queries the trigger source for the A→B sequential edge  
trigger reset feature.

**Group** Trigger

**Syntax** TRIGger:B:RESET:EDGE:SOURce {CH<x>|CH<x>\_D<x>}  
TRIGger:B:RESET:EDGE:SOURce?

**Arguments** CH<x> specifies an analog channel as the trigger source.  
CH<x>\_D<x> specifies a digital channel as the trigger source.

**Examples** TRIGGER:B:RESET:EDGE:SOURCE CH4 sets Channel 4 as the input source for  
the trigger reset.  
TRIGGER:B:RESET:EDGE:SOURCE? might return  
TRIGGER:B:RESET:EDGE:SOURCE CH1, indicating that the current input  
source for the trigger reset is Channel 1.

## TRIGger:B:RESET:TIMEOut:TIME

This command sets or queries the reset timer for a sequential timeout trigger reset.

**Group** Trigger

**Syntax** TRIGger:B:RESET:TIMEOut:TIME <NR3>  
TRIGger:B:RESET:TIMEOut:TIME?

**Arguments** <NR3> is the reset timer for a sequential timeout trigger reset.

**Examples** TRIGGER:B:RESET:TIMEOUT:TIME 100e-9 sets the time to 100 ns.  
TRIGGER:B:RESET:TIMEOUT:TIME? might return  
TRIGGER:B:RESET:TIMEOUT:TIME 20.0E-9 indicating the timeout time  
is set to 20 ns.

## TRIGger:B:RESET:TYPE

This command sets or queries the type of A→B sequential trigger reset. If the B trigger reset is active, the reset criteria are part of the B triggering sequence. If the reset conditions defined by the reset type are met, the instrument must start over searching for a new occurrence of the A event.

You must identify a trigger Source and Threshold for each reset type, except for the Timeout trigger type.

---

**NOTE.** *If a reset condition occurs, the reset criteria itself is reset and must start over.*

---

|                  |                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                            |
| <b>Syntax</b>    | TRIGger:B:RESET:TYPE {NONE TIMEOut EDGE}<br>TRIGger:B:RESET:TYPE?                                                                                                                                                                  |
| <b>Arguments</b> | NONE defeats the trigger reset feature.<br><br>TIMEOut initiates a reset if the timeout conditions specified by TRIGger:B:RESET:TIMEOut are met.<br><br>EDGE initiates a reset if the edge trigger conditions are met.             |
| <b>Examples</b>  | TRIGGER:B:RESET:TYPE NONE deactivates the sequential trigger reset.<br><br>TRIGGER:B:RESET:TYPE? This query might return TRIGGER:B:RESET:TYPE TIMEOUT, indicating that the sequential trigger reset is active following a timeout. |

## TRIGger:B:STATE

This command sets or queries the state of B trigger activity. If the B trigger state is on, the B trigger is part of the triggering sequence. If the B trigger state is off, then only the A trigger causes the trigger event.

|                         |                                                    |
|-------------------------|----------------------------------------------------|
| <b>Group</b>            | Trigger                                            |
| <b>Syntax</b>           | TRIGger:B:STATE {ON OFF <NR1>}<br>TRIGger:B:STATE? |
| <b>Related Commands</b> | <a href="#">TRIGger:A:MODE</a>                     |

**Arguments** ON indicates that the B trigger is active and causes trigger events with the A trigger.  
OFF indicates that only the A trigger causes trigger events.  
<NR1> is an integer number. 0 turns off the B trigger; any other value activates the B trigger.

**Examples** TRIGGER:B:STATE ON sets the B trigger to active, making it capable of causing trigger events.  
TRIGGER:B:STATE? might return TRIGGER:B:STATE 0, indicating that the B trigger is inactive and that only the A trigger causes trigger events.

## TRIGger:B:TIME

This command sets or queries B trigger delay time, in seconds. The B Trigger time applies only if TRIGger:B:BY is set to TIME.

**Group** Trigger

**Syntax** TRIGger:B:TIME <NR3>  
TRIGger:B:TIME?

**Related Commands** [TRIGger:B:BY](#)  
[TRIGger:B:EVENTS:COUNT](#)  
[TRIGger:B:STATE](#)

**Arguments** <NR3> is the B trigger delay time in seconds.

**Examples** TRIGGER:B:TIME 4E-6 sets the B trigger delay time to 4  $\mu$ s.  
TRIGGER:B:TIME? might return TRIGGER:B:TIME 16.0000E-9, indicating that the B trigger time is set to 16 ns.

## TRIGger:HYSteresis:USER:STATe

This command enables or disables user-defined trigger hysteresis.

**Group** Trigger

**Syntax** TRIGGER:HYStereSis:USER:STATe {ON|OFF|1|0}  
TRIGGER:HYStereSis:USER:STATe?

**Related Commands** [TRIGGER:HYStereSis:USER:VALue](#)

**Arguments** ON enables user-defined trigger hysteresis.  
OFF disables user-defined trigger hysteresis.  
1 enables user-defined trigger hysteresis.  
0 disables user-defined trigger hysteresis.

**Examples** TRIGGER:HYStereSis:USER:STATe ON enables user-defined trigger hysteresis.  
TRIGGER:HYStereSis:USER:STATe? might return  
TRIGGER:HYStereSis:USER:STATe 0, indicating that the user-defined trigger hysteresis is disabled.

## TRIGGER:HYStereSis:USER:VALue

This command sets or returns the height of the user-defined trigger hysteresis zone in volts.

**Group** Trigger

**Syntax** TRIGGER:HYStereSis:USER:VALue <NR1>  
TRIGGER:HYStereSis:USER:VALue?

**Related Commands** [TRIGGER:HYStereSis:USER:STATe](#)

**Arguments** <NR1> sets the height of the hysteresis zone in volts.

**Examples** TRIGGER:HYStereSis:USER:VALue 27.0e-3 sets the height of the hysteresis zone to 27 mV.  
TRIGGER:HYStereSis:USER:VALue? might return  
TRIGGER:HYStereSis:USER:VALue 27.0e-3, indicating that the height of the hysteresis zone is 27 mV.

## TRIGger:STATE? (Query Only)

This query-only command returns the current state of the triggering system.

**Group** Trigger

**Syntax** TRIGger:STATE?

**Related Commands** [TRIGger:A:MODE](#)

**Returns** ARMED indicates that the instrument is acquiring pretrigger information.  
AUTO indicates that the instrument is in the automatic mode and acquires data even in the absence of a trigger.  
READY indicates that all pretrigger information is acquired and that the instrument is ready to accept a trigger.  
SAVE indicates that the instrument is in save mode and is not acquiring data.  
TRIGGER indicates that the instrument triggered and is acquiring the post trigger information.

**Examples** TRIGGER:STATE? might return TRIGGER:STATE ARMED, indicating that the pretrigger data is being acquired.

## TRIGger:STATUs? (Query Only)

This query-only command returns the current status of the triggering system.

**Group** Trigger

**Syntax** TRIGger:STATUs?

**Returns** ARM indicates that the instrument is acquiring pretrigger information.  
AUTO indicates that the instrument is in the automatic mode and acquires data even in the absence of a trigger.  
REA indicates that all pretrigger information is acquired and that the instrument is ready to accept a trigger.  
SAV indicates that the instrument is in save mode and is not acquiring data.

TRIG indicates that the instrument triggered and is acquiring the post trigger information.

**Examples** TRIGGER:STATUS? might return :TRIGGER:STATUS ARM, indicating that the pretrigger data is being acquired.

## \*TST? (Query Only)

Tests (self-test) the interface and returns a 0.

**Group** Miscellaneous

**Syntax** \*TST?

**Examples** \*TST? always returns 0.

## TSTamptable:ADDNew (No Query Form)

This command adds a new History time stamp results table to the scope application.

**Group** History

**Syntax** TSTamptable:ADDNew <QString>

**Arguments** <QString> specifies the History time stamp results table name.

**Examples** TSTAMPABLE:ADDNEW "TABLE1" adds a new table view by the name TABLE1.

## TSTamptable:DELETE (No Query Form)

This command deletes the requested History time stamp results table.

**Group** History

**Syntax** TSTamptable:DELETE <QString>

**Arguments** <QString> specifies the History time stamp results table name.

**Examples** TSTAMPtable:DELETE "TABLE1" deletes History time stamp results table TABLE1 from the view.

## TSTamptable:LIST? (Query Only)

This command queries the list of History time stamp results tables has been added.

**Group** History

**Syntax** TSTamptable:LIST?

**Returns** Returns a list of all currently defined History time stamp results tables.

**Examples** TSTAMPtable:LIST? might return :TSTamptable:LIST TABLE1, TABLE2, indicating there are two History time stamp result tables.

## UNDO (No Query Form)

Reverts the instrument settings to a state before the previous command or user interface action.

**Group** Miscellaneous

**Syntax** UNDO

**Examples** UNDO reverts the instrument settings to a state before the previous command or user interface action.

## UNLock (No Query Form)

This command (no query form) unlocks the front panel controls only. To unlock the front panel controls and the touch screen use the LOCK NONE command. The command TOUCHScreen:STATE ON enables the touch screen only.

---

**NOTE.** *If the instrument is in the Remote With Lockout State (RWLS), the UNLock command has no effect. For more information, see the ANSI-IEEE Std 488.1-1987 Standard Digital Interface for Programmable Instrumentation, section 2.8.3 on RL State Descriptions.*

---

|                         |                                                                    |
|-------------------------|--------------------------------------------------------------------|
| <b>Group</b>            | Miscellaneous                                                      |
| <b>Syntax</b>           | UNLock ALL                                                         |
| <b>Related Commands</b> | <a href="#">LOCK</a>                                               |
| <b>Arguments</b>        | ALL specifies that all front panel buttons and knobs are unlocked. |
| <b>Examples</b>         | UNLOCK ALL unlocks all front panel buttons and knobs.              |

## USBDevice:CONFigure

This command may be used to configure the rear USB port to be off or enabled as a USBTMC device. Users should be cautious using this command via the USBTMC interface as a change to the configuration of this interface from a USBTMC device will cause USBTMC communication to cease. It is intended to be used via the Ethernet interface to control the USB device interface.

|                  |                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Miscellaneous                                                                                                                                                     |
| <b>Syntax</b>    | USBDevice:CONFigure {DISabled USBTmc}<br>USBDevice:CONFigure?                                                                                                     |
| <b>Arguments</b> | DISabled will disable the rear USB port.<br>USBTmc enables the rear USB port.                                                                                     |
| <b>Examples</b>  | USBDEVICE:CONFIGURE DISABLED will disable the rear USB port.<br>USBDEVICE:CONFIGURE? might return :USBDEVICE:CONFIGURE USBTMC indicating the USB port is enabled. |

## VERBose

This command sets or queries the Verbose state that controls the length of keywords on query responses. Keywords can be both headers and arguments.

---

**NOTE.** *This command does not affect IEEE Std 488.2-1987 Common Commands (those starting with an asterisk).*

---

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Syntax</b>    | VERTical:DESKew:FROM:CUSTOMPROPagation <NR3><br>VERTical:DESKew:FROM:CUSTOMPROPagation?                                                                                                                                                     |
| <b>Arguments</b> | <NR3> is a target (FROM) delay that you can specify when the propagation delay of the target (FROM) probe used for deskew cannot be detected automatically.                                                                                 |
| <b>Examples</b>  | <p>VERTICAL:DESKEW:FROM:CUSTOMPROPAGATION 0.25e-9 sets the custom delay to 250 ps.</p> <p>VERTICAL:DESKEW:FROM:CUSTOMPROPAGATION? might return<br/>:VERTICAL:DESKEW:FROM:CUSTOMPROPAGATION 0.0E+0 indicating the custom delay is 0.0 s.</p> |

## VERTical:DESKew:FROM:SOURce

This command sets or queries the source channel for performing channel-to-channel deskew adjustment. Sources can be any of the analog channels.

|                  |                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Vertical                                                                                                                                                                                                 |
| <b>Syntax</b>    | VERTical:DESKew:FROM:SOURce CH<x><br>VERTical:DESKew:FROM:SOURce?                                                                                                                                        |
| <b>Arguments</b> | CH<x> specifies an analog channel as the source.                                                                                                                                                         |
| <b>Examples</b>  | <p>VERTICAL:DESKEW:FROM:SOURCE CH1 sets channel 1 as the from source.</p> <p>VERTICAL:DESKEW:FROM:SOURCE? might return<br/>:VERTICAL:DESKEW:FROM:SOURCE CH2 indicating channel 2 is the from source.</p> |

## VERTical:DESKew:STATIC (No Query Form)

This command executes static deskew using the deskew settings.

|                  |                                                                                      |
|------------------|--------------------------------------------------------------------------------------|
| <b>Group</b>     | Vertical                                                                             |
| <b>Syntax</b>    | VERTical:DESKew:STATIC EXECute                                                       |
| <b>Arguments</b> | EXECute will execute static deskew using the deskew settings.                        |
| <b>Examples</b>  | VERTICAL:DESKew:STATIC EXECUTE will execute static deskew using the deskew settings. |

## VERTical:DESKew:TO:CUSTOMPROPagation

This command sets or queries a target (TO) delay that can be specified by the user when the propagation delay of the target (TO) probe used for deskew cannot be detected automatically.

|                  |                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Vertical                                                                                                                                                                                                                                          |
| <b>Syntax</b>    | VERTical:DESKew:TO:CUSTOMPROPagation <NR3>                                                                                                                                                                                                        |
| <b>Arguments</b> | <NR3> is a target (TO) delay that can be specified by the user when the propagation delay of the target (TO) probe used for deskew cannot be detected automatically.                                                                              |
| <b>Examples</b>  | VERTICAL:DESKew:TO:CUSTOMPROPAGATION 0.25e-9 sets the custom propagation to 250 ps.<br><br>VERTICAL:DESKew:TO:CUSTOMPROPAGATION? might return<br>:VERTICAL:DESKew:TO:CUSTOMPROPAGATION 0.0E+0 indicating the custom propagation is set to 0.0 ns. |

## VERTical:DESKew:TO:SOURce

This command sets or queries the target channel for performing channel-to-channel deskew adjustment. Target sources can be any of the live analog channels.

## VISual:AREA<x>:ASPEctratio

Sets or queries whether the aspect ratio of the specified Visual Trigger area is locked.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Syntax</b>    | <code>VISual:AREA&lt;x&gt;:ASPEctratio {ON OFF &lt;NR1&gt;}</code><br><code>VISual:AREA&lt;x&gt;:ASPEctratio?</code>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Arguments</b> | <code>Area&lt;x&gt;</code> specifies the integer number of a Visual Trigger area.<br><br><code>ON</code> locks the aspect ratio of the specified Visual Trigger area. The aspect ratio is kept constant when the height or width of the area changes.<br><br><code>OFF</code> unlocks the aspect ratio of the specified Visual Trigger area.<br><br><code>&lt;NR1&gt;</code> is an integer number. 1 locks the aspect ratio of the specified Visual Trigger area; any other value unlocks the aspect ratio of the specified Visual Trigger area |
| <b>Examples</b>  | <code>VISual:AREA6:ASPEctratio ON</code> locks the aspect ratio of area 6.<br><br><code>VISual:AREA2:ASPEctratio?</code> might return <code>VISual:AREA2:ASPEctratio OFF,</code> indicating that the aspect ratio of area 2 is not locked.                                                                                                                                                                                                                                                                                                      |

## VISual:AREA<x>:FLIP:HORizontal (No Query Form)

Flips the specified Visual Trigger area horizontally around its center point.

|              |         |
|--------------|---------|
| <b>Group</b> | Trigger |
|--------------|---------|

**Syntax** VISual:AREA<x>:FLIP:HORizontal

**Related Commands** [VISual:AREA<x>:FLIP:VERTical](#)

**Arguments** AREA<x> specifies the integer number of a Visual Trigger area.

**Examples** VISual:AREA1:FLIP:HORizontal horizontally flips area 1.

## VISual:AREA<x>:FLIP:VERTical (No Query Form)

Flips the specified Visual Trigger area vertically around its center point.

**Group** Trigger

**Syntax** VISual:AREA<x>:FLIP:VERTical

**Related Commands** [VISual:AREA<x>:FLIP:HORizontal](#)

**Arguments** AREA<x> specifies the integer number of a Visual Trigger area.

**Examples** VISual:AREA8:FLIP:VERTical vertically flips area 8.

## VISual:AREA<x>:HEIGHT

Sets or queries the height of the specified Visual Trigger area.

**Group** Trigger

**Syntax** VISual:AREA<x>:HEIGHT <NR3>  
VISual:AREA<x>:HEIGHT?

**Arguments** AREA<x> specifies the integer number of a Visual Trigger area.  
<NR3> specifies the height of the Visual Trigger area in amplitude.

**Examples** `VISual:AREA51:HEIGHT 3.5` sets the height of area 51 to 3.5 (volts or Amps).  
`VISual:AREA4:HEIGHT?` might return `VISual:AREA4:HEIGHT 15`, indicating that the height of area 4 is 15.

## VISual:AREA<x>:HITType

Sets or queries the area hit logic true condition for the specified Visual Trigger area.

**Group** Trigger

**Syntax** `VISual:AREA<x>:HITType {IN|OUT|DONTcare}`  
`VISual:AREA<x>:HITType?`

**Arguments** `AREA<x>` specifies the integer number of a Visual Trigger area.

`IN` specifies that the waveform must intrude anywhere into the specified area to be true.

`OUT` specifies that the waveform must not intrude anywhere into the specified area to be true.

`DONTcare` sets the area to a don't care state, causing the area to be ignored. This is useful when you are developing a Visual Trigger condition and need to change the hit logic type of an area while keeping the area.

**Examples** `VISual:AREA2:HITType OUT` sets the area 2 hit type to OUT.  
`VISual:AREA5:HITType?` might return `VISual:AREA5:HITType IN`, indicating that the waveform must intrude into area 5 to be true.

## VISual:AREA<x>:RESET (No Query Form)

Sets the specified Visual Trigger area shape to a default-sized triangle.

**Group** Trigger

**Syntax** `VISual:AREA<x>:RESET`

**Arguments** `AREA<x>` specifies the integer number of a Visual Trigger area.

**Examples**    `VISual:AREA2:RESET` changes area 2 to a default triangle shape.

## **VISual:AREA<x>:ROTation**

Sets or queries the rotation angle of the specified Visual Trigger area.

**Group**    Trigger

**Syntax**    `VISual:AREA<x>:ROTation <NR3>`  
`VISual:AREA<x>:ROTation?`

**Arguments**    `AREA<x>` specifies the integer number of a Visual Trigger area.  
  
`<NR3>` specifies the rotation angle of the Visual Trigger area, in positive degrees from 0 to 360. Zero degrees is referenced from when the area was created.

**Examples**    `VISual:AREA2:ROTation 45` rotates Visual Trigger area 2 by 45 degrees.  
  
`VISual:AREA1:ROTation?` might return `VISual:AREA1:ROTation -60`, indicating that area 4 rotation position is minus 60 degrees.

## **VISual:AREA<x>:SHAPE**

Sets or queries the current shape of the area.

**Group**    Trigger

**Syntax**    `VISual:AREA<x>:SHAPE {TRIANGLE|RECTANGLE|TRAPEZOID|HEXAGON}`  
`VISual:AREA<x>:SHAPE?`

**Arguments**    `AREA<x>` specifies the integer number of a Visual Trigger area.  
  
`TRIANGLE` sets the specified area to a triangular shape (three vertices). If the area does not exist, the instrument creates a new triangular area with the specified area number.  
  
`RECTANGLE` sets the specified area to a rectangular shape (four vertices, right angles at each corner). If the area does not exist, the instrument creates a new triangular area with the specified area number.  
  
`TRAPEZOID` sets the specified area to a trapezoidal shape (four vertices, two parallel sides). If the area does not exist, the instrument creates a new triangular area with the specified area number.

HEXAgon sets the specified area to a hexagonal shape (six vertices). If the area does not exist, the instrument creates a new hexagonal area with the specified area number.

**Returns** CUSTOm indicates that the shape is a custom-created shape, or the positions of one or more vertices of a standard shape have been changed.

**Examples** VISua1:AREA1:SHAPE Hexagon sets area 1 to be a hexagonal shape, or creates a new area 1 hexagonal shape if the specified area does not exist.

VISua1:AREA2:SHAPE? might return VISua1:AREA2:SHAPE CUSTOM, indicating that area 2 is a custom shape.

## VISua1:AREA<x>:SOUrce

Sets or queries the signal source for the specified Visual Trigger area. The source can only be an analog channel.

**Group** Trigger

**Syntax** VISua1:AREA<x>:SOUrce CH<x>  
VISua1:AREA<x>:SOUrce?

**Arguments** AREA<x> specifies the integer number of a Visual Trigger area.

CH<x> sets the source channel number for the specified area. The channel number is specified by <x>.

**Examples** VISua1:AREA1:SOUrce CH3 sets the source channel number for area 1 to Channel 3.

VISua1:AREA6:SOUrce? might return VISua1:AREA6:SOUrce CH8, indicating that the source for area 6 is Channel 8.

## VISua1:AREA<x>:VERTICES

Sets or queries the X and Y vertex coordinate values for all vertices of the specified Visual Trigger area. Vertex values must be set in pairs.

**Group** Trigger

**Syntax** `VISual:AREA<x>:VERTICES "<NR3>, <NR3>, <NR3>, <NR3>, <NR3>, <NR3> [, <NR3>, <NR3>, ...]"`  
`VISual:AREA<x>:VERTICES?`

**Arguments** `AREA<x>` specifies the integer number of a Visual Trigger area.  
`<NR3>, <NR3>` specifies the X, Y coordinate pair of each vertex in an area. The first value is X (time) and the second value is Y (amplitude). There must be a minimum of three vertex pairs to create an area. If the specified area exists, the area is changed to the shape specified in the arguments. If the specified area does not exist, a new area is created and assigned the specified vertices.

**Examples** `VISual:AREA3:VERTICES`  
`"400E-9,1,400E-9,0.5,600E-9,0.5,600E-9,1"` sets or creates area 3 as a rectangle that is 200 ns wide by 500 mV high.  
`VISual:AREA3:VERTICES?` might return `VISual:AREA3:VERTICES`  
`"171.1E-9,-141.7E-3,321.1E-9,-141.7E-3,283.6E-9,1.708,208.6E-9,1.708"`, indicating that area 3 is defined as a trapezoid that is 150 ns wide by 1.85 V high.

## VISual:AREA<x>:WIDTH

Sets or queries the width of the specified Visual Trigger area.

**Group** Trigger

**Syntax** `VISual:AREA<x>:WIDTH <NR3>`  
`VISual:AREA<x>:WIDTH?`

**Arguments** `AREA<x>` specifies the integer number of a Visual Trigger area.  
`<NR3>` specifies the width of the Visual Trigger area in seconds.

**Examples** `VISual:AREA5:WIDTH 0.000045` sets the width of area 5 to 4.5  $\mu$ s.  
`VISual:AREA3:WIDTH?` might return `VISual:AREA3:WIDTH 0.000016`, indicating that the width of area 3 is 16  $\mu$ s.

## VISual:AREA<x>:XPOSITION

Sets or queries the horizontal (X-axis) center position of the specified Visual Trigger area.

|                  |                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                                                                             |
| <b>Syntax</b>    | VISual:AREA<x>:XPOSITION <NR3><br>VISual:AREA<x>:XPOSITION?                                                                                                                                                                                                         |
| <b>Arguments</b> | AREA<x> specifies the integer number of a Visual Trigger area.<br><br><NR3> specifies the horizontal position of the center of the Visual Trigger area, in seconds.                                                                                                 |
| <b>Examples</b>  | VISual:AREA1:XPOSITION -6.9e-6 sets the horizontal center of area 1 to be -6.9 $\mu$ s from the trigger point.<br><br>VISual:AREA3:XPOSITION? might return VISual:AREA3:XPOSITION 8.0e-6, indicating that the center of area 3 is 8 $\mu$ s from the trigger point. |

## VISual:AREA<x>:YPOSITION

Sets or queries the vertical (Y-axis) center position of the specified Visual Trigger area.

|                  |                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>     | Trigger                                                                                                                                                                                                     |
| <b>Syntax</b>    | VISual:AREA<x>:YPOSITION <NR3><br>VISual:AREA<x>:YPOSITION?                                                                                                                                                 |
| <b>Arguments</b> | AREA<x> specifies the integer number of a Visual Trigger area.<br><br><NR3> specifies the vertical position of the center of the Visual Trigger area, in amplitude (volts, amps).                           |
| <b>Examples</b>  | VISual:AREA1:YPOSITION 0.5 sets the vertical center of area 1 to be 500 mV.<br><br>VISual:AREA3:YPOSITION? might return VISual:AREA3:YPOSITION 2, indicating that the vertical center of area 3 is 2 volts. |

## VISual:DELETEALL (No Query Form)

Deletes all Visual Trigger areas.

|              |         |
|--------------|---------|
| <b>Group</b> | Trigger |
|--------------|---------|

**Syntax** VISUAL:DELETEALL

**Examples** VISUAL:DELETEALL deletes all Visual Trigger areas.

## VISUAL:ENABLE

Sets or queries the status (on or off) of the Visual Trigger mode.

**Group** Trigger

**Syntax** VISUAL:ENABLE {ON|OFF|<NR1>}  
VISUAL:ENABLE?

**Arguments** ON enables the Visual Trigger mode.  
OFF disables the Visual Trigger mode.  
<NR1> is an integer number. 0 turns off the Visual Trigger mode; any other value enables Visual Trigger mode.

**Examples** VISUAL:ENABLE ON enables the Visual Trigger function.  
VISUAL:ENABLE? might return VISUAL:ENABLE OFF, indicating that Visual Trigger mode is not enabled.

## VISUAL:EQATION

Sets or queries the Visual Trigger area combination logic equation.

**Group** Trigger

**Syntax** VISUAL:EQATION <QString>  
VISUAL:EQATION?

**Arguments** <QString> defines the Visual Trigger area combination logic equation. The equation is made up of area names (A<x>) combined with logic operators AND, OR, or XOR (&, |, ^). It may also contain parentheses for grouping. The equation must be true to have a valid Visual Trigger event and display a waveform. Each area's true state depends on the area's condition setting (In, Out or Don't Care).

**Examples** `VISual:EQUation "(A1 & A2) | A3"` sets the combined area logic such that both areas 1 and 2 must be true, or area 3 must be true, to have a valid Visual Trigger event and display a waveform.

`VISual:EQUation?` might return `VISual:EQUation "A1 & A2 & A3 & A4"`, indicating that the area combination logic equation requires that areas 1 through 4 must be true to have a valid Visual Trigger event.

## VISual:SHOWAREas

Shows or hides all Visual Trigger areas.

**Group** Trigger

**Syntax** `VISual:SHOWAREas {ON|OFF|<NR1>}`  
`VISual:SHOWAREas?`

**Arguments** `ON` shows all Visual Trigger areas.  
`OFF` hides all Visual Trigger areas.  
`<NR1>` is an integer number. `0` hides all Visual Trigger areas; any other value shows all Visual Trigger areas.

**Examples** `VISual:SHOWAREas OFF` hides all Visual Trigger areas.

`VISual:SHOWAREas?` might return `VISual:SHOWAREas ON`, indicating that Visual Trigger areas are displayed on the screen.

## VISual:SHOWCRiteria

Sets or queries display of the area names and hit criteria for all visual trigger areas.

**Group** Trigger

**Syntax** `VISual:SHOWCRiteria {ON|OFF|<NR1>}`  
`VISual:SHOWCRiteria?`

**Arguments** `ON` enables display of the area name and hit criteria labels (In, Out, Don't care icons) of all Visual Trigger areas.  
`OFF` hides the area name and hit criteria labels (In, Out, Don't care icons) of all Visual Trigger areas.

<NR1> is an integer number. 0 hides the area name and hit criteria of all Visual Trigger areas; any other value enables displaying the area name and hit criteria of all Visual Trigger areas.

**Examples** `VISual:SHOWCriteria OFF` hides the name and hit criteria labels of all Visual Trigger areas.

`VISual:SHOWCriteria?` might return `VISual:SHOWCriteria ON`, indicating that the name and hit criteria labels of all Visual Trigger areas are displayed.

## VISual:SHOWEQuation

Shows or hides the Visual Trigger area combination logic equation.

**Group** Trigger

**Syntax** `VISual:SHOWEQuation {ON|OFF|<NR1>}`  
`VISual:SHOWEQuation?`

**Arguments** `ON` shows the Visual Trigger area combination logic equation.

`OFF` hides the Visual Trigger area combination logic equation.

<NR1> is an integer number. 0 hides the area combination logic equation; any other value displays the area combination logic equation.

**Examples** `VISual:SHOWEQuation ON` shows the Visual Trigger area combination logic equation.

`VISual:SHOWEQuation?` might return `VISual:SHOWEQuation OFF`, indicating that the Visual Trigger area combination logic equation is not displayed on the screen.

## VXI:ENABle

This command sets or queries the state of the VXI-11 server, which is used for command and control over an Ethernet connection.

**Group** Miscellaneous

**Syntax** `VXI:ENABle {ON|OFF|1|0}`  
`VXI:ENABle?`

**Arguments** ON enables the VXI-11 server.  
 OFF disables the VXI-11 server.  
 1 enables the VXI-11 server.  
 0 disables the VXI-11 server.

**Examples** `VXI:ENABle ON` enables the VXI-11 server.  
`VXI:ENABle?` might return `:VXI:ENABle OFF`, indicating the VXI-11 server is disabled.

## VXI:PORT:HIGH

This command sets or queries the higher end of the port range for the VXI-11 server.

**Group** Miscellaneous

**Syntax** `VXI:PORT:HIGH <NR1>`  
`VXI:PORT:HIGH?`

**Arguments** `<NR1>` is the high end of the TCPIP port range for the VXI-11 server connection. Some ports are restricted and cannot be used because they are used by other services. If a restricted port falls between the VXI-11 server low port and the VXI-11 server high port, then the error code 224 (Illegal parameter value) is posted to the event queue and the VXI-11 high port remains unchanged. If the VXI-11 high port number is set to a valid value below the VXI-11 low port number, the VXI-11 low port number is set to the value of the VXI-11 high port number minus one.

**Examples** `VXI:PORT:HIGH 7010` sets the VXI-11 high port number to 7010.  
`VXI:PORT:HIGH?` might return `:VXI:PORT:HIGH 7010`, indicating that the port number is 7010.

## VXI:PORT:LOW

This command sets or queries the lower end of the port range for the VXI-11 server.

**Group** Miscellaneous

**Syntax**    `VXI:PORT:LOW <NR1>`  
`VXI:PORT:LOW?`

**Arguments**    <NR1> is the low end of the TCPIP port range for the VXI-11 server connection. Some ports are restricted and cannot be used because they are used by other services. If a restricted port falls between the VXI-11 server low port and the VXI-11 server high port, then the error code 224 (Illegal parameter value) is posted to the event queue and the VXI-11 low port remains unchanged. If the VXI-11 low port number is set to a valid value above the VXI-11 high port number, the VXI-11 high port number is set to the value of the VXI-11 low port number plus one.

**Examples**    `VXI:PORT:LOW 7000` sets the VXI-11 low port number to 7010.  
`VXI:PORT:LOW?` might return `:VXI:PORT:LOW 7000`, indicating that the port number is 7000.

## \*WAI (No Query Form)

The \*WAI (Wait) command (no query form) prevents the instrument from executing further commands or queries until all pending commands that generate an OPC message are complete. This command allows you to synchronize the operation of the instrument with your application program. For more information, refer to Synchronization Methods.

**Group**    Status and Error

**Syntax**    \*WAI

**Related Commands**    [BUSY?](#)  
[\\*OPC](#)

**Examples**    \*WAI prevents the instrument from executing any further commands or queries until all pending commands that generate an OPC message are complete.

## WAVFrm? (Query Only)

This query-only command provides the Tektronix standard waveform query which returns the waveform preamble followed by the waveform data for the source specified by :DATA:SOURce using the :DATA settings for encoding, width, and so forth.

|                         |                                                                                                                                                                                                                                                                                                                                      |

## WFMOuPre? (Query Only)

This query-only command queries the waveform formatting data for the waveform specified by the [DATa:SOUrce](#) command. The preamble components are considered to be of two types; formatting and interpretation. The formatting components are: ENCDg, BN\_Fmt, BYT\_Or, BYT\_Nr, BIT\_Nr. The interpretation components are derived from the [DATa:SOUrce](#) specified waveform.

|                 |                                                                                                                                                                                                                                                                                                                                                |

## WFMOuPre:ASC\_Fmt? (Query Only)

This query returns the format for ASCII data transferred from the instrument. No command form is provided as the format is determined by the data source type. Some waveforms are normalized vector data where the data points are

8-byte doubles in floating point format whereas other formats are 1-byte or 2-byte integers.

**Group** Waveform Transfer

**Syntax** WFMOutpre:ASC\_Fmt?

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:BN\\_Fmt](#)  
[WFMOutpre:ENCdg](#)

**Returns** FP represents floating point ASCII data. The waveforms are normalized vector data where the data points are 8-byte doubles in floating point format.  
 INTEGER represents signed integer ASCII data. The waveform data are 1-byte or 2-byte integers.

**Examples** WFMOutpre:ASC\_Fmt? might return WFMOUTPRE:ASC\_FMT INTEGER indicating the ASCII format is integer.

## WFMOutpre:BIT\_Nr

This command sets and queries the number of bits per waveform point that outgoing waveforms contain, as specified by the [DATA:SOURce](#) command. Note that values will be constrained according to the underlying waveform data. This specification is only meaningful when [WFMOutpre:ENCdg](#) is set to BIN and [WFMOutpre:BN\\_Fmt](#) is set to either RI or RP.

**Group** Waveform Transfer

**Syntax** WFMOutpre:BIT\_Nr <NR1>  
 WFMOutpre:BIT\_Nr?

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:BN\\_Fmt](#)  
[WFMOutpre:ENCdg](#)

**Arguments** <NR1> number of bits per data point can be 8 or 16.

**Examples** `WFMOUTPRE:BIT_NR 16` sets the number of bits per waveform point to 16 for incoming RI and RP binary format data.

`WFMOUTPRE:BIT_NR?` might return `WFMOUTPRE:BIT_NR 8`, indicating that outgoing RI or RP binary format data uses 8 bits per waveform point.

## WFMOutpre:BN\_Fmt

This command sets or queries the format of binary data for outgoing waveforms specified by the [DATA:SOURce](#) command.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:BN_Fmt {RI|RP|FP}`  
`WFMOutpre:BN_Fmt?`

**Related Commands** [DATA:SOURce](#)

**Arguments** RI specifies signed integer data point representation.

RP specifies positive integer data point representation.

FP specifies floating point representation.

**Examples** `WFMOUTPRE:BN_FMT FP` specifies that outgoing waveform data will be in single-precision binary floating point format.

`WFMOUTPRE:BN_FMT?` might return `WFMOUTPRE:BN_FMT RI`, indicating that the outgoing waveform data is currently in signed integer format.

## WFMOutpre:BYT\_Nr

This command sets or queries the binary field data width (bytes per point) for the waveform specified by the [DATA:SOURce](#) command. Note that values will be constrained according to the underlying waveform data. This specification is only meaningful when [WFMOutpre:ENCdg](#) is set to BIN, and [WFMOutpre:BN\\_Fmt](#) is set to either RI or RP.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:BYT_Nr <NR1>`  
`WFMOutpre:BYT_Nr?`

**Related Commands**    [DATA:SOURce](#)  
                               [WFMOUtpre:BN\\_Fmt](#)  
                               [WFMOUtpre:ENCdg](#)

**Arguments**    <NR1> is the number of bytes per data point and can be 1, 2 or 8. A value of 1 or 2 bytes per waveform point indicates channel data; 8 bytes per waveform point indicate pixel map (fast acquisition) data.

**Examples**    WFMOUTPRE:BYT\_NR 1 sets the number of bytes per outgoing waveform data point to 1, which is the default setting.  
                       WFMOUTPRE:BYT\_NR? might return WFMOUTPRE:BYT\_NR 2, indicating that there are 2 bytes per outgoing waveform data point.

## WFMOUtpre:BYT\_Or

This command sets or queries which byte of binary waveform data is transmitted first, during a waveform data transfer, when data points require more than one byte. This specification only has meaning when [WFMOUtpre:ENCdg](#) is set to BIN.

**Group**    Waveform Transfer

**Syntax**    WFMOutpre:BYT\_Or {LSB|MSB}  
                   WFMOutpre:BYT\_Or?

**Related Commands**    [WFMOUtpre:ENCdg](#)

**Arguments**    LSB specifies that the least significant byte will be transmitted first.  
                       MSB specifies that the most significant byte will be transmitted first.

**Examples**    WFMOUTPRE:BYT\_OR MSB sets the most significant outgoing byte of waveform data to be transmitted first.  
                       WFMOUTPRE:BYT\_OR? might return WFMOUTPRE:BYT\_OR LSB, indicating that the least significant data byte will be transmitted first.

## WFMOutpre:CENTERFREQUENCY? (Query Only)

This query returns the center frequency of the outgoing waveform. The center frequency is a precise frequency at the center of the display of the frequency domain graticule. In many applications, it is a carrier frequency.

**Group** Waveform Transfer

**Syntax** WFMOutpre:CENTERFREQUENCY?

**Related Commands** [DATA:SOURce](#)

**Returns** Returns the center frequency of the outgoing waveform, in Hertz.

**Examples** WFMOutpre:CENTERFREQUENCY? might return  
WFMOutpre:CENTERFREQUENCY 1.0E+9, indicating a center frequency of 1 GHz.

## WFMOutpre:DOMAIN? (Query Only)

This query returns the domain of the outgoing waveform, either TIME or FREQUENCY. If the domain is TIME, it indicates that the data is to be treated as integer information. If the domain is FREQUENCY, it indicates that the data is to be treated as floating point information.

**Group** Waveform Transfer

**Syntax** WFMOutpre:DOMAIN?

**Related Commands** [DATA:SOURce](#)

[WFMOutpre:BN\\_Fmt](#)

[WFMOutpre:ENCdg](#)

**Returns** Returns the domain of the outgoing waveform.

**Examples** WFMOUTPRE:DOMAIN? might return WFMOUTPRE:DOMAIN TIME, indicating that the outgoing waveform is a time domain trace.

WFMOutpre:DOMain? might return WFMOutpre:DOMain FREQUENCY, indicating that the outgoing waveform is one of the four Spectrum View frequency domain traces (CH<x>\_SV\_NORMAL, CH<x>\_SV\_AVERAGE, CH<x>\_SV\_MINHOLD, or CH<x>\_SV\_MAXHOLD).

## WFMOutpre:ENCdg

This command sets or queries the type of encoding for outgoing waveforms.

**Group** Waveform Transfer

**Syntax** WFMOutpre:ENCdg {ASCIi|BINArY}  
WFMOutpre:ENCdg?

**Related Commands** [DATA:ENCdg](#)  
[WFMOutpre:BYT\\_Nr](#)  
[WFMOutpre:BYT\\_Or](#)  
[WFMOutpre:BIT\\_Nr](#)  
[WFMOutpre:BN\\_Fmt](#)

**Arguments** ASCIi specifies that the outgoing data is to be in ASCII format. Waveforms internally stored as integers will be sent as <NR1> numbers, while those stored as floating point will be sent as <NR3> numbers.

BINArY specifies that outgoing data is to be in a binary format whose further specification is determined by [WFMOutpre:BYT\\_Nr](#), [WFMOutpre:BIT\\_Nr](#), [WFMOutpre:BN\\_Fmt](#) and [WFMOutpre:BYT\\_Or](#).

**Examples** WFMOUTPRE:ENCDG ASCIi specifies that the outgoing waveform data will be sent in ASCII format.

WFMOUTPRE:ENCDG? might return WFMOUTPRE:ENCDG BINArY, indicating that outgoing waveform data will be sent in binary format.

## WFMOutpre:NR\_Pt? (Query Only)

This query-only command returns the number of points for the [DATA:SOURce](#) waveform that will be transmitted in response to a [CURVe??](#) query.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:NR_Pt?`

**Related Commands** [CURVe?](#)  
[DATa](#)  
[DATa:START](#)  
[DATa:STOP](#)  
[SAVe:WAVEform](#)  
[SAVEON:WAVEform:FILEFormat](#)

**Examples** `WFMOUTPRE:NR_PT?` might return `WFMOUTPRE:NR_PT 5000`, indicating that there are 5000 data points to be sent.

## WFMOutpre:PT\_Fmt? (Query Only)

This query-only command returns the point format for the waveform specified by the [DATa:SOUrce](#) command. The format specifies a set of equations describing how the scale factors in the preamble are used to give meaning to the [CURVe?](#) data points.

An error is reported if the `DATa:SOUrce` waveform does not exist.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:PT_Fmt?`

**Related Commands** [CURVe?](#)  
[DATa:SOUrce](#)

**Examples** `WFMOUTPRE:PT_FMT?` might return `WFMOutpre:PT_Fmt ENV`, indicating that the waveform data is a series of min-max pairs.

## WFMOutpre:PT\_Off? (Query Only)

This query-only command returns the trigger point relative to [DATa:START](#) for the waveform specified by the [DATa:SOUrce](#) command.

---

**NOTE.** *This returned value is the point immediately following the actual trigger.*

---

**Group** Waveform Transfer

**Syntax** WFMOutpre:PT\_Off?

**Related Commands** [DATA:SOURce](#)  
[DATA:START](#)  
[WFMOutpre:XZEro?](#)

**Examples** WFMOUTPRE:PT\_OFF? might return WFMOUTPRE:PT\_OFF 251 specifying that the trigger actually occurred between points 250 and 251.

## WFMOutpre:PT\_ORder? (Query Only)

This query-only command specifies whether the source waveform is Fast Acquisition. A Fast Acquisition waveform is stored as a 500 (vertical) by 1000 (horizontal) point bitmap. Each point represents display intensity for that screen location. Only CURVE? query functions are allowed on Fast Acquisition waveforms. When the WFMOutpre:PT\_ORDER? query returns Row, this indicates that the source is a Fast Acquisition waveform (and that each of 1000 possible horizontal columns being transmitted contains 500 vertical points. Note: 500 might vary based on how many channels enabled from same FastAcq group.) and waveform points are transmitted in the following order: left to right; then top to bottom.

When the WFMOutpre:PT\_Order? query returns Linear, this indicates that the source is not a Fast Acquisition waveform (and that each horizontal column being sent contains only one vertical point). Note that waveform points are transmitted in the following order: top to bottom, then left to right.

**Group** Waveform Transfer

**Syntax** WFMOutpre:PT\_Order?

**Related Commands** [DATA:SOURce](#)

**Examples** WFMOUTPRE:PT\_ORDER? might return WFMOUTPRE:PT\_Order ROW, specifying that the waveform designated by the DATA:SOURce waveform is a Fast Acquisition waveform and CURve? is returning the PIXmap data for that source.

WFMOUtpRE:PT\_ORDER? might return WFMOUtpRE:PT\_Order LINEAR, specifying that the source waveform is a non-Fast Acquisition waveform and CURve? is returning the Vector data for that source.

## WFMOUtpre:RESample

This command sets or queries the resampling of outgoing waveform data. This command is equivalent to setting DATA:RESample. Setting the WFMOUtpre:RESample value causes the corresponding DATA value to be updated and vice versa.

**Group** Waveform Transfer

**Syntax** WFMOUtpre:RESample <NR1>  
WFMOUtpre:RESample?

**Related Commands** [DATA:RESample](#)

**Arguments** <NR1> is the resampling rate. The default value is 1, which means every sample is returned. A value of 2 returns every other sample, while a value of 3 returns every third sample, and so on.

**Examples** WFMOUtpRE:RESAMPLE 1 sets the resampling to return all waveform data samples.

WFMOUtpRE:RESAMPLE? might return WFMOUtpRE:RESAMPLE 4, indicating that every fourth sample of the waveform data is returned.

## WFMOUtpre:SPAN? (Query Only)

This query returns the frequency span of the outgoing waveform. The span is the range of frequencies you can observe around the center frequency.

**Group** Waveform Transfer

**Syntax** WFMOUtpre:SPAN?

**Related Commands** [DATA:SOUrce](#)

**Returns** Returns the frequency span of the outgoing waveform, in Hertz.

**Examples** RF:SPAN? might return RF:SPAN 10.0000E+6, indicating the span is 10 MHz.

## WFMOutpre:WFId? (Query Only)

This query-only command returns a string describing several aspects of the acquisition parameters for the waveform specified by the [DATA:SOURce](#) command.

An error is reported if the DATA:SOURce waveform does not exist.

**Group** Waveform Transfer

**Syntax** WFMOutpre:WFId?

**Related Commands** [DATA:SOURce](#)

**Returns** <QString> contains the following comma-separated fields documented in the following tables:

**Table 2-54: Waveform Suffixes**

| Field       | Description                                                                                                                                                            | Examples                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Source      | The source identification string as it appears in the front panel scale factor readouts.                                                                               | "CH1-8"<br>"MATH<x>"<br>"REF<x>"                                                                                                                    |
| Coupling    | A string describing the vertical coupling of the waveform (the Source1 waveform in the case of Dual Waveform Math).                                                    | "AC coupling"<br>"DC coupling"<br>"GND coupling"                                                                                                    |
| Vert Scale  | A string containing the vertical scale factor of the unzoomed waveform. The numeric portion will always be four digits. The examples cover all known internal units.   | "100.0 mV/div"<br>"20.00 dB/div"<br>"45.00 deg/div"<br>"785.4 mrad/div"<br>"500.0 μVs/div"<br>"10.00 kV/s/div"<br>"200.0 mV/div"<br>"50.00 unk/div" |
| Horiz Scale | A string containing the horizontal scale factor of the unzoomed waveform. The numeric portion will always be four digits. The examples cover all known internal units. | "100 ms/div"<br>"10.00 kHz/div"<br>"50.00 c/div"                                                                                                    |

**Table 2-54: Waveform Suffixes (cont.)**

| Field            | Description                                                                                                                   | Examples                                                                                |
|------------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Record Length    | A string containing the number of waveform points available in the entire record. The numeric portion is given as an integer. | "500 points"<br>"500000 points"                                                         |
| Acquisition Mode | A string describing the mode used to acquire the waveform.                                                                    | "Sample mode"<br>"Pk Detect mode"<br>"Hi Res mode"<br>"Envelope mode"<br>"Average mode" |
| Center Frequency | A string containing the center frequency value of the waveform.                                                               | "2.400GHz"                                                                              |
| Span             | A string containing the frequency span value of the waveform.                                                                 | "20.00MHz"                                                                              |
| Reference Level  | A string containing the reference level value of the waveform.                                                                | "1.000mW"                                                                               |

**Examples** WFMOUTPRE:WFID? might return WFMOUTPRE:WFID "Ch1, DC coupling,100.0mVolts/div,500.0µs/div,500 points, Hi Res mode".

## WFMOutpre:WFMTYPE? (Query Only)

This query returns the type of the outgoing waveform.

The type of waveform that is being transferred in turn determines in which window it will display on the instrument screen: (the Waveform View window or Spectrum View window). Both the Analog and RF\_TD arguments specify the time domain window; the RF\_RD argument specifies the frequency domain window.

**Group** Waveform Transfer

**Syntax** WFMOutpre:WFMTYPE?

**Related Commands** [DATA:SOURce](#)

**Returns** Returns the type of the outgoing waveform:  
 ANALOG indicates a Channel or Math waveform.  
 SV\_FD indicates a Spectrum View RF frequency domain waveform.  
 RF\_TD indicates an RF time domain waveform.

**Examples** `WFMOutpre:WFMTYPE?` might return `WFMOutpre:WFMTYPE CH<x>_SV_FD`, which indicates that the outgoing waveform is an RF frequency domain waveform (`CH<x>_SV_AVErAge`, `CH<x>_SV_MAXHOld`, `CH<x>_SV_MINHOld`, or `CH<x>_SV_NORMAl`).

## WFMOutpre:XINcr? (Query Only)

This query-only command returns the horizontal point spacing in units of `WFMOutpre:XUNit` for the waveform specified by the `DATA:SOURce` command. This value corresponds to the sampling interval.

An error is reported if the `DATA:SOURce` waveform does not exist.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:XINcr?`

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:XUNit?](#)

**Examples** `WFMOUTPRE:XINCR?` might return `WFMOUTPRE:XINCR 10.0000E-6`, indicating that the horizontal sampling interval is 10  $\mu$ s/point (500  $\mu$ s/div).

## WFMOutpre:XUNit? (Query Only)

This query-only command returns the horizontal units for the waveform specified by the `DATA:SOURce` command.

An error is reported if the `DATA:SOURce` waveform does not exist.

**Group** Waveform Transfer

**Syntax** `WFMOutpre:XUNit?`

**Related Commands** [DATA:SOURce](#)

**Examples** `WFMOUTPRE:XUNIT?` might return `WFMOUTPRE:XUNIT "HZ"`, indicating that the horizontal units for the waveform are in Hertz.

## WFMOutpre:XZEro? (Query Only)

This query-only command returns the sub-sample time between the trigger sample (designated by PT\_OFF) and the occurrence of the actual trigger for the waveform specified by the [DATA:SOURce](#) command. This value is in units of WFMOutpre:XUNit.

An error is reported if the DATA:SOURce waveform does not exist.

---

**NOTE.** *During steady state operation, when all control changes have settled and triggers are arriving on a regular basis, this is the only part of the preamble that changes on each acquisition.*

---

**Group** Waveform Transfer

**Syntax** WFMOutpre:XZEro?

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:XUNit?](#)

**Examples** WFMOUTPRE:XZERO? might return WFMOUTPRE:XZERO 5.6300E-9, indicating that the trigger actually occurred 5.63 ns before the trigger sample.

## WFMOutpre:YMUIt? (Query Only)

This query-only command returns the vertical scale factor per digitizing level in units specified by WFMOutpre:YUNit for the waveform specified by the [DATA:SOURce](#) command. For those formats in which [WFMOutpre:BYT\\_Nr](#) is important (all non-floating point formats), WFMOutpre:YMUIt? must take the location of the binary point implied by BYT\_NR into consideration.

An error is reported if the DATA:SOURce waveform does not exist.

**Group** Waveform Transfer

**Syntax** WFMOutpre:YMUIt?

**Related Commands** [DATA:SOURce](#)

**Examples** WFMOUTPRE:YMULT? might return WFMOUTPRE:YMULT 4.0000E-3, indicating that the vertical scale for the corresponding waveform is 100 mV/div.

## WFMOutpre:YOFF? (Query Only)

This query-only command returns the vertical offset of the source specified by [DATA:SOURce](#). For this instrument family, the value returned is always 0.0 as the offset is combined with the :YZEro value.

An error is reported if the [DATA:SOURce](#) waveform does not exist.

**Group** Waveform Transfer

**Syntax** WFMOutpre:YOFF?

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:BYT\\_Nr](#)

**Examples** WFMOUTPRE:YOFF? might return WFMOUTPRE:YOFF -50.0000E+0, indicating that the position indicator for the waveform was 50 digitizing levels (2 divisions) below center screen.

## WFMOutpre:YUNIT? (Query Only)

This query-only command returns the vertical units for the waveform specified by the [DATA:SOURce](#) command.

An error is reported if the [DATA:SOURce](#) waveform does not exist.

**Group** Waveform Transfer

**Syntax** WFMOutpre:YUNIT?

**Related Commands** [DATA:SOURce](#)

**Examples** WFMOUTPRE:YUNIT? might return WFMOUTPRE:YUNIT "dB", indicating that the vertical units for the waveform are measured in decibels.

## WFMOutpre:YZero? (Query Only)

This query-only command returns the combined vertical position and offset for the source waveform specified by [DATA:SOURce](#). This represents a departure from previous instruments where the :YZero value represented the vertical position in vertical units and the :YOff value represented the vertical offset in digitizing levels. For this instrument family, the value of :YOff is always 0.0.

An error is reported if the [DATA:SOURce](#) waveform does not exist.

**Group** Waveform Transfer

**Syntax** WFMOutpre:YZero?

**Related Commands** [DATA:SOURce](#)  
[WFMOutpre:YUNit?](#)

**Examples** WFMOUTPRE:YZERO? might return WFMOUTPRE:YZERO -100.0000E-3, indicating that vertical offset is set to -100 mV.

# Status and Events

The instrument provides a status and event reporting system for the Ethernet and USB interfaces. This system informs you of certain significant events that occur within the instrument.

The instrument status handling system consists of five 8-bit registers and two queues for each interface. The remaining Status subtopics describe these registers and components. They also explain how the event handling system operates.

## Registers

### Overview

The registers in the event handling system fall into two functional groups:

- Status Registers contain information about the status of the instrument. They include the Standard Event Status Register (SESR).
- Enable Registers determine whether selected types of events are reported to the Status Registers and the Event Queue. They include the Device Event Status Enable Register (DESER), the Event Status Enable Register (ESER), and the Service Request Enable Register (SRER).

### Status Registers

The Standard Event Status Register (SESR) and the Status Byte Register (SBR) record certain types of events that may occur while the instrument is in use. IEEE Std 488.2-1987 defines these registers.

Each bit in a Status Register records a particular type of event, such as an execution error or message available. When an event of a given type occurs, the instrument sets the bit that represents that type of event to a value of one. (You can disable bits so that they ignore events and remain at zero. See Enable Registers). Reading the status registers tells you what types of events have occurred.

**The Standard Event Status Register (SESR).** The SESR records eight types of events that can occur within the instrument. Use the \*ESR? query to read the SESR register. Reading the register clears the bits of the register so that the register can accumulate information about new events.

---

**NOTE.** TekVISA applications use SESR bit 6 to respond to any of several events, including some front panel actions.

---

Figure 3-1: The Standard Event Status Register (SESR)

**Table 3-1: SESR Bit Functions**

| Bit     | Function |                                                                                                                                                  |
|---------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 (MSB) | PON      | Power On. Shows that the instrument was powered on. On completion, the diagnostic self tests also set this bit.                                  |
| 6       | URQ      | User Request. Indicates that an application event has occurred. *See note.                                                                       |
| 5       | CME      | Command Error. Shows that an error occurred while the instrument was parsing a command or query.                                                 |
| 4       | EXE      | Execution Error. Shows that an error executing a command or query.                                                                               |
| 3       | DDE      | Device Error. Shows that a device error occurred.                                                                                                |
| 2       | QYE      | Query Error. Either an attempt was made to read the Output Queue when no data was present or pending, or that data in the Output Queue was lost. |
| 1       | RQC      | Request Control. This is not used.                                                                                                               |
| 0 (LSB) | OPC      | operation complete. Shows that the operation is complete. This bit is set when all pending operations complete following an *OPC command.        |

**The Status Byte Register (SBR).** Records whether output is available in the Output Queue, whether the instrument requests service, and whether the SESR has recorded any events.

Use a Serial Poll or the \*STB? query to read the contents of the SBR. The bits in the SBR are set and cleared depending on the contents of the SESR, the Event Status Enable Register (ESER), and the Output Queue. When you use a Serial Poll to obtain the SBR, bit 6 is the RQS bit. When you use the \*STB? query to obtain the SBR, bit 6 is the MSS bit. Reading the SBR does not clear the bits.

**Figure 3-2: The Status Byte Register (SBR)**

**Table 3-2: SBR Bit Functions**

| Bit     | Function |                                                                                                               |
|---------|----------|---------------------------------------------------------------------------------------------------------------|
| 7 (MSB) | —        | Not used.                                                                                                     |
| 6       | RQS      | Request Service. Obtained from a serial poll. Shows that the instrument requests service from the controller. |
| 6       | MSS      | Master Status Summary. Obtained from *STB? query. Summarizes the ESB and MAV bits in the SBR.                 |
| 5       | ESB      | Event Status Bit. Shows that status is enabled and present in the SESR.                                       |

**Table 3-2: SBR Bit Functions (cont.)**

| Bit | Function                                                                   |
|-----|----------------------------------------------------------------------------|
| 4   | MAV Message Available. Shows that output is available in the Output Queue. |
| 3   | ———— Not used.                                                             |
| 2   | ———— Not used.                                                             |
| 1-0 | ———— Not used.                                                             |

### Enable Registers

DESER, ESER, and SRER allow you to select which events are reported to the Status Registers and the Event Queue. Each Enable Register acts as a filter to a Status Register (the DESER also acts as a filter to the Event Queue) and can prevent information from being recorded in the register or queue.

Each bit in an Enable Register corresponds to a bit in the Status Register it controls. In order for an event to be reported to a bit in the Status Register, the corresponding bit in the Enable Register must be set to one. If the bit in the Enable Register is set to zero, the event is not recorded.

Various commands set the bits in the Enable Registers. The Enable Registers and the commands used to set them are described below.

**The Device Event Status Enable Register (DESER).** This register controls which types of events are reported to the SESR and the Event Queue. The bits in the DESER correspond to those in the SESR.

Use the DESE command to enable and disable the bits in the DESER. Use the DESE? query to read the DESER.

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| PON | URQ | CME | EXE | DDE | QYE | RQC | OPC |

**Figure 3-3: The Device Event Status Enable Register (DESER)**

**The Event Status Enable Register (ESER).** This register controls which types of events are summarized by the Event Status Bit (ESB) in the SBR. Use the \*ESE command to set the bits in the ESER. Use the \*ESE? query to read it.

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| PON | URQ | CME | EXE | DDE | QYE | RQC | OPC |

**Figure 3-4: The Event Status Enable Register (ESER)**

**The Service Request Enable Register (SRER).** This register controls which bits in the SBR generate a Service Request and are summarized by the Master Status Summary (MSS) bit.

Use the \*SRE command to set the SRER. Use the \*SRE? query to read the register. The RQS bit remains set to one until either the Status Byte Register is read with a Serial Poll or the MSS bit changes back to a zero.

|   |   |     |     |   |   |   |   |
|---|---|-----|-----|---|---|---|---|
| 7 | 6 | 5   | 4   | 3 | 2 | 1 | 0 |
| — | — | ESB | MAV | — | — | — | — |

Figure 3-5: The Service Request Enable Register (SRER)

**\*PSC Command** The \*PSC command controls the Enable Registers contents at power-on. Sending \*PSC 1 sets the Enable Registers at power on as follows:

- DESER 255 (equivalent to a DESe 255 command)
- ESER 0 (equivalent to an \*ESE 0 command)
- SRER 0 (equivalent to an \*SRE 0 command)

Sending \*PSC 0 lets the Enable Registers maintain their values in nonvolatile memory through a power cycle.

---

**NOTE.** To enable the PON (Power On) event to generate a Service Request, send \*PSC 0, use the DESe and \*ESE commands to enable PON in the DESER and ESER, and use the \*SRE command to enable bit 5 in the SRER. Subsequent power-on cycles will generate a Service Request.

---

## Queues

The \*PSC command controls the Enable Registers contents at power-on. Sending \*PSC 1 sets the Enable Registers at power on as follows:

**Output Queue** The instrument stores query responses in the Output Queue and empties this queue each time it receives a new command or query message after an <EOM>. The controller must read a query response before it sends the next command (or query) or it will lose responses to earlier queries.

---

**CAUTION.** When a controller sends a query, an <EOM>, and a second query, the instrument normally clears the first response and outputs the second while reporting a Query Error (QYE bit in the ESER) to indicate the lost response. A fast controller, however, may receive a part or all of the first response as well. To avoid this situation, the controller should always read the response immediately after sending any terminated query message or send a DCL (Device Clear) before sending the second query.

---

**Event Queue** The Event Queue stores detailed information on up to 33 events. If than 32 events stack up in the Event Queue, the 32nd event is replaced by event code 350, "Queue Overflow."

Read the Event Queue with the `EVENT?` query (which returns only the event number), with the `EVMSG?` query (which returns the event number and a text description of the event), or with the `ALLEV?` query (which returns all the event numbers along with a description of the event). Reading an event removes it from the queue.

Before reading an event from the Event Queue, you must use the `*ESR?` query to read the summary of the event from the SESR. This makes the events summarized by the `*ESR?` read available to the `EVENT?` and `EVMSG?` queries, and empties the SESR.

Reading the SESR erases any events that were summarized by previous `*ESR?` reads but not read from the Event Queue. Events that follow an `*ESR?` read are put in the Event Queue but are not available until `*ESR?` is used again.

## Event Handling Sequence

The following figure shows how to use the status and event handling system. In the explanation that follows, numbers in parentheses refer to numbers in the figure.

Figure 3-6: Status and Event Handling Process

When an event occurs, a signal is sent to the DESER (1). If that type of event is enabled in the DESER (that is, if the bit for that event type is set to 1), the appropriate bit in the SESR is set to one, and the event is recorded in the Event Queue (2). If the corresponding bit in the ESER is also enabled (3), then the ESB bit in the SBR is set to one (4).

When output is sent to the Output Queue, the MAV bit in the SBR is set to one (5).

When a bit in the SBR is set to one and the corresponding bit in the SRER is enabled (6), the MSS bit in the SBR is set to one and a service request is generated (7).

## Synchronization Methods

**Overview** Although most commands are completed almost immediately after being received by the instrument, some commands start a process that requires time. For example, once a single sequence acquisition command is executed, depending upon the applied signals and trigger settings, it may take an extended period of time before the acquisition is complete. Rather than remain idle while the operation is in process, the instrument will continue processing other commands. This means that some operations will not be completed in the order that they were sent. Furthermore, sometimes the result of an operation depends upon the result of an earlier operation. A first operation must complete before the next one is processed.

In order to handle these situations, the instrument status and event reporting system allows you to synchronize the operation of the instrument with your application program, using the Operation Complete function. Note, however, that only some operations are able to take advantage of this function; a table is provided below of commands that support this.

The following commands are used to synchronize the instrument functions using Operation Complete. See examples of how to use these commands later on in this section:

**\*OPC** — sending the \*OPC command will set bit 0 of the SESR (Standard Events Status Register). The bit will only be set high when all pending operations that generate an OPC message have finished execution. (The SESR is queried using \*ESR?) The \*OPC? query form returns 1 only when all operations have completed, or a device clear is received.

**\*WAI** — prevents the instrument from executing further commands or queries until all pending commands that generate an OPC message are complete.

**BUSY?** — returns the status of operations: 1 means there are pending operations, 0 means that all pending operations are complete.

---

**NOTE.** *Some OPC operations may require an extended period of time to complete or may never complete. For example, a single sequence acquisition may never complete when no trigger event occurs. You should be aware of these conditions and tailor your program accordingly by:*

— *setting the timeout sufficiently for the anticipated maximum time for the operation and*

— *handle a timeout appropriately by querying the SESR (\*ESR?) and event queue (EVMsg? or ALLEv?).*

---

**NOTE.** The \*OPC command form can also be used to cause an SRQ to be generated upon completion of all pending operations. This requires that the ESB (Event Status Bit, bit 5) of the SRER (Service Request Enable Register) is set, and the OPC bit (bit 0) of the DESR (Device Event Status Enable Register) and the ESER (Event Status Enable Register) are set. (The SRER is set/queried using \*SRE. The DESR is set/queried using DESE. The ESER is set/queried using \*ESE.)

Only a subset of instrument operations support the Operation Complete function (OPC):

**Table 3-3: instrument operations that can generate OPC**

| Command                                              | Conditions                                                               |
|------------------------------------------------------|--------------------------------------------------------------------------|
| ACQuire:STATE <non-zero NR1>  ON RUN                 | Only when in single sequence acquisition mode                            |
| :AUTOset < EXECute >                                 |                                                                          |
| CALibrate:INTERNAI                                   |                                                                          |
| CALibrate:INTERNAI:START                             |                                                                          |
| CALibrate:FACTory START                              |                                                                          |

### Example of Acquiring and Measuring a Single-Sequence Waveform

For example, a typical application might involve acquiring a single-sequence waveform and then taking a measurement on the acquired waveform. You could use the following command sequence to do this:

```

/** Set up conditional acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000
ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE
/** Acquire waveform data */
ACQUIRE:STATE ON
/** Set up the measurement parameters */
MEASUREMENT:MEAS1:TYPE AMPLITUDE
MEASUREMENT:MEAS1:SOURCE CH1
/** Take amplitude measurement */
MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

The acquisition of the waveform requires extended processing time. It may not finish before the instrument takes an amplitude measurement (see the following figure). This can result in an incorrect amplitude value.

**Figure 3-7: Command Processing Without Using Synchronization**

To ensure the instrument completes waveform acquisition before taking the measurement on the acquired data, you can synchronize the program using `*WAI`, `BUSY`, `*OPC`, and `*OPC?`.

**Figure 3-8: Processing Sequence With Synchronization**

### Example of Using the \*OPC Command

If the corresponding status registers are enabled, the `*OPC` command sets the OPC bit in the Standard Event Status Register (SESR) when an operation is complete. You achieve synchronization by using this command with either a serial poll or service request handler.

**Serial Poll Method:** Enable the OPC bit in the Device Event Status Enable Register (DESER) and the Event Status Enable Register (ESER) using the DESE and \*ESE commands.

When the operation is complete, the OPC bit in the Standard Event Status Register (SESR) will be enabled and the Event Status Bit (ESB) in the Status Byte Register will be enabled.

The same command sequence using the \*OPC command for synchronization with serial polling looks like this:

```

/* Set up conditional acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000
ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE
/* Enable the status registers */
DESE 1
*ESE 1
*SRE 0
/* Acquire waveform data */
ACQUIRE:STATE ON
/* Set up the measurement parameters on the channel we're
about to sequence */
MEASUREMENT:MEAS1:TYPE AMPLITUDE
MEASUREMENT:MEAS1:SOURCE CH1
/* wait until the acquisition is complete before taking the
measurement. */
*OPC
while serial poll = 0, keep looping
/* Take amplitude measurement */
MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

This technique requires less bus traffic than did looping on BUSY.

**Service Request Method:** Enable the OPC bit in the Device Event Status Enable Register (DESER) and the Event Status Enable Register (ESER) using the DESE and \*ESE commands.

You can also enable service requests by setting the ESB bit in the Service Request Enable Register (SRER) using the \*SRE command. When the operation is complete, the instrument will generate a Service Request.

The same command sequence using the \*OPC command for synchronization looks like this

```

/* Set up conditional acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000

```

```

ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE
/* Enable the status registers */
DESE 1
*ESE 1
*SRE 32

/* Set up the measurement parameters on the channel we're
about to sequence */ :MEASUREMENT:MEAS1:TYPE AMPLITUDE
:MEASUREMENT:MEAS1:SOURCE CH1
/* Acquire waveform data */
ACQUIRE:STATE ON
/* wait until the acquisition is complete before taking the
measurement*/
*OPC

```

The program can now do different tasks such as talk to other devices. The SRQ, when it comes, interrupts those tasks and returns control to this task.

```

/* Take amplitude measurement */
MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

### Example of Using the \*OPC? Query

The \*OPC? query places a 1 in the Output Queue once an operation that generates an OPC message is complete. The \*OPC? query does not return until all pending OPC operations have completed. Therefore, your time-out must be set to a time at least as long as the longest expected time for the operations to complete.

The same command sequence using the \*OPC? query for synchronization looks like this:

```

/* Set up single sequence acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000
ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE
/* Set up the measurement parameters on the channel we're
about to sequence */
MEASUREMENT:MEAS1:TYPE AMPLITUDE
MEASUREMENT:MEAS1:SOURCE CH1
/* Acquire waveform data */
ACQUIRE:STATE ON
/* wait until the acquisition is complete before taking the
measurement*/
*OPC?

```

Wait for read from Output Queue.

```

/* Take amplitude measurement */
MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

This is the simplest approach. It requires no status handling or loops. However, you must set the controller time-out for longer than the acquisition operation.

### Example of Using the \*WAI Command

The \*WAI command forces completion of previous commands that generate an OPC message. No commands after the \*WAI are processed before the OPC message(s) are generated

The same command sequence using the \*WAI command for synchronization looks like this:

```

/* Set up conditional acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000
ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE
/* Set up the measurement parameters on the channel we're
about to sequence */
MEASUREMENT:MEAS1:TYPE AMPLITUDE
MEASUREMENT:MEAS1:SOURCE CH1
/* Acquire waveform data */
ACQUIRE:STATE ON
/* wait until the acquisition is complete before taking
the measurement*/
*/
*WAI
/* Take amplitude measurement */
MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

The controller can continue to write commands to the input buffer of the instrument, but the commands will not be processed by the instrument until all in-process OPC operations are complete. If the input buffer becomes full, the controller will be unable to write commands to the buffer. This can cause a time-out.

### Example of Using the BUSY? Query

The BUSY? query allows you to find out whether the instrument is busy processing a command that has an extended processing time such as single-sequence acquisition.

The same command sequence, using the BUSY? query for synchronization, looks like this:

```

/* Set up conditional acquisition */
ACQUIRE:STATE OFF
DISPLAY:WAVEVIEW1:CH1:STATE 1
HORIZONTAL:RECORDLENGTH 1000
ACQUIRE:MODE SAMPLE
ACQUIRE:STOPAFTER SEQUENCE

```

```

/* Acquire waveform data */
ACQUIRE:STATE ON
/* Set up the measurement parameters */
MEASUREMENT:IMMED:TYPE AMPLITUDE
MEASUREMENT:IMMED:SOURCE CH1
/* wait until the acquisition is complete before taking
the measurement */
while BUSY? keep looping
/* Take amplitude measurement */
MEASUREMENT:IMMED:VALUE?

```

This sequence lets you create your own wait loop rather than using the \*WAI command. The BUSY? query helps you avoid time-outs caused by writing too many commands to the input buffer. The controller is still tied up though, and the repeated BUSY? query will result in bus traffic.

### Reference waveforms

Measurements on references also support OPC when used in conjunction with a :RECALL:WAVEFORM command.

```

/* Load the waveform file */
:RECALL:WAVEFORM "C:/Digital8.wfm",REF1
*OPC?
/* Set up the measurement parameters on the reference */
:MEASUREMENT:MEAS1:TYPE PERIOD
:MEASUREMENT:MEAS1:SOURCE REF1
*OPC?
/* wait for read from Output Queue. */
/* Take amplitude measurement */
:MEASUREMENT:MEAS1:RESULTS:CURRENTACQ:MEAN?

```

### Messages

The information contained in the topics above covers all the programming interface messages the instrument generates in response to commands and queries.

For most messages, a secondary message from the instrument gives detail about the cause of the error or the meaning of the message. This message is part of the message string and is separated from the main message by a semicolon.

Each message is the result of an event. Each type of event sets a specific bit in the SESR and is controlled by the equivalent bit in the DESER. Thus, each message is associated with a specific SESR bit. In the message tables, the associated SESR bit is specified in the table title, with exceptions noted with the error message text.

### No Event

The following table shows the messages when the system has no events or status to report. These have no associated SESR bit.

**Table 3-4: No Event Messages**

| <b>Code</b> | <b>Message</b>                                |
|-------------|-----------------------------------------------|
| 0           | No events to report; queue empty              |
| 1           | No events to report; new events pending *ESR? |

**Command Error**

The following table shows the command error messages generated by improper syntax. Check that the command is properly formed and that it follows the rules in the section on command Syntax.

**Table 3-5: Command Error Messages (CME Bit 5)**

| <b>Code</b> | <b>Message</b>               |
|-------------|------------------------------|
| 100         | Command error                |
| 101         | Invalid character            |
| 102         | Syntax error                 |
| 103         | Invalid separator            |
| 104         | Data type error              |
| 105         | GET not allowed              |
| 108         | Parameter not allowed        |
| 109         | Missing parameter            |
| 110         | Command header error         |
| 112         | Program mnemonic too long    |
| 113         | Undefined header             |
| 120         | Numeric data error           |
| 121         | Invalid character in numeric |
| 123         | Exponent too large           |
| 124         | Too many digits              |
| 130         | Suffix error                 |
| 131         | Invalid suffix               |
| 134         | Suffix too long              |
| 140         | Character data error         |
| 141         | Invalid character data       |
| 144         | Character data too long      |
| 150         | String data error            |
| 151         | Invalid string data          |
| 152         | String data too long         |
| 160         | Block data error             |
| 161         | Invalid block data           |
| 170         | Command expression error     |
| 171         | Invalid expression           |

**Execution Error** The following table lists the execution errors that are detected during execution of a command.

**Table 3-6: Execution Error Messages (EXE Bit 4)**

| <b>Code</b> | <b>Message</b>                                          |
|-------------|---------------------------------------------------------|
| 200         | Execution error                                         |
| 221         | Settings conflict                                       |
| 222         | Data out of range                                       |
| 224         | Illegal parameter value                                 |
| 241         | Hardware missing                                        |
| 250         | Mass storage error                                      |
| 251         | Missing mass storage                                    |
| 252         | Missing media                                           |
| 253         | Corrupt media                                           |
| 254         | Media full                                              |
| 255         | Directory full                                          |

| 2500 | Setup error, file does not look like a setup file       |

Table 3-6: Execution Error Messages (EXE Bit 4) (cont.)

| Code | Message                                                        |
|------|----------------------------------------------------------------|
| 2501 | Setup warning, could not recall all values from external setup |
| 2620 | Mask error, too few points received                            |
| 2760 | Mark limit reached                                             |
| 2761 | No mark present                                                |
| 2762 | Search copy failed                                             |

**Device Error** The following table lists the device errors that can occur during instrument operation. These errors may indicate that the instrument needs repair.

Table 3-7: Device Error Messages (DDE Bit 3)

| Code | Message                 |
|------|-------------------------|
| 310  | System error            |
| 311  | Memory error            |
| 312  | PUD memory lost         |
| 314  | Save/recall memory lost |

**System Event** The following table lists the system event messages. These messages are generated whenever certain system conditions occur.

Table 3-8: System Event Messages

| Code | Message                                                      |
|------|--------------------------------------------------------------|
| 400  | Query event                                                  |
| 401  | Power on (PON bit 7 set)                                     |
| 402  | Operation complete (OPC bit 0 set)                           |
| 403  | User request (URQ bit 6 set)                                 |
| 404  | Power fail (DDE bit 3 set)                                   |
| 405  | Request control                                              |
| 410  | Query INTERRUPTED (QYE bit 2 set)                            |
| 420  | Query UNTERMINATED (QYE bit 2 set)                           |
| 430  | Query DEADLOCKED (QYE bit 2 set)                             |
| 440  | Query UNTERMINATED after indefinite response (QYE bit 2 set) |
| 468  | Knob/Keypad value changed                                    |
| 472  | Application variable changed                                 |

**Execution Warning** The following table lists warning messages that do not interrupt the flow of command execution. They also notify you of possible unexpected results.

**Table 3-9: Execution Warning Messages (EXE Bit 4)**

| <b>Code</b> | <b>Message</b>                                  |
|-------------|-------------------------------------------------|
| 528         | Parameter out of range                          |
| 532         | Curve data too long, Curve truncated            |
| 533         | Curve error, Preamble values are inconsistent   |
| 540         | Measurement warning, Uncertain edge             |
| 541         | Measurement warning, Low signal amplitude       |
| 542         | Measurement warning, Unstable histogram         |
| 543         | Measurement warning, Low resolution             |
| 544         | Measurement warning, Uncertain edge             |
| 545         | Measurement warning, Invalid in minmax          |
| 546         | Measurement warning, Need 3 edges               |
| 547         | Measurement warning, Clipping positive/negative |
| 548         | Measurement warning, Clipping positive          |
| 549         | Measurement warning, Clipping negative          |

**Table 3-10: Execution Warning Messages (EXE Bit 4)**

| <b>Code</b> | <b>Message</b>                                  |
|-------------|-------------------------------------------------|
| 540         | Measurement warning                             |
| 541         | Measurement warning, Low signal amplitude       |
| 542         | Measurement warning, Unstable histogram         |
| 543         | Measurement warning, Low resolution             |
| 544         | Measurement warning, Uncertain edge             |
| 545         | Measurement warning, Invalid min max            |
| 546         | Measurement warning, Need 3 edges               |
| 547         | Measurement warning, Clipping positive/negative |
| 548         | Measurement warning, Clipping positive          |
| 549         | Measurement warning, Clipping negative          |

**Internal Warning**

The following table shows internal errors that indicate an internal fault in the instrument.

**Table 3-11: Internal Warning Messages**

| <b>Code</b> | <b>Message</b>                 |
|-------------|--------------------------------|
| 630         | Internal warning, 50Ω overload |

# Appendix C: Factory Defaults

## Default Setup

The following table lists the default values for each command.

**NOTE.** Find the most up-to-date default values for your instrument and software by performing a TekSecure command, saving the instrument setup and looking at the instrument or setup file.

Table C-1: Default Values

| Item                                    | Description  |
|-----------------------------------------|--------------|
| ACQUIRE:FASTACQ:PALETTE                 | TEMPERATURE  |

# Appendix D: Waveform Transfer (WFMOutpre? and CURVe? Query) Examples

Here are several examples of command sequences using the WFMOutpre? and CURVe? queries to transfer data from the instrument to a PC, with different data sources, including Analog, Digital waveforms. Each command sequence example is followed by an explanation of the returned WFMOutpre? results. The WFMOutpre? values act as settings that apply to the CURVe query data being transferred.

---

**NOTE.** In order to guarantee that the waveform data returned from CURVe? queries of multiple waveforms are correlated to the same acquisition, you should use single sequence acquisition mode to acquire the waveform data from a single acquisition. Single sequence acquisition mode is enabled using SEQUENCE.

---

## Example 1: Analog Waveform (Channels 1–4)

Goal: Transfer 10,000 points of analog channel waveform data from the instrument to a PC.

| Command                 | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| :WFMOutpre:ENCdg BINARY |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| :WFMOutpre:BYT_Nr 1     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| :HEADer 1               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| :WFMOutpre?             | Returns the following values. Each value represents the current settings that a CURVe? query will use to format the data that will be transferred from the instrument to a PC or other device (see next table for explanations):<br><br>:WFMOUTPRE:BYT_NR 1;BIT_NR 8;ENCDG BINARY;BN_FMT RI;BYT_OR MSB;WFID "Ch1, DC coupling, 100.0mV/div, 4.000us/div, 10000 points, Sample mode";NR_PT 10000;PT_FMT Y;PT_ORDER LINEAR;XUNIT "s";XINCR 4.0000E-9;XZERO 139.9999E-12;PT_OFF 5000;YUNIT "v";YMULT 4.0000E-3;YOFF 0.0E+0;YZERO 0.0E+0 |
| :CURVe?                 | Returns 10,000 data points:<br><br>:CURVe #510000<10,000 binary bytes of waveform data.>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

---

**NOTE.** You can also use the WAVFrm? query, which concatenates the WFMOutpre? and CURVe? queries.

---

| WFMOupre? Query results                                                      | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BYT_NR 1                                                                     | This value specifies the number of bytes per data point in the waveform data. To change this value automatically, use the <a href="#">WFMOupre:BYT_Nr</a> command. Note that changing this value automatically changes the BIT_NR value accordingly. (This value can also be set using the command.)                                                                                                                                         |
| BIT_NR 8                                                                     | This value specifies the number of bits per data point in the waveform data. To change this value, use the <a href="#">WFMOupre:BIT_Nr</a> command. Note that changing this value automatically changes the BYT_NR value accordingly.                                                                                                                                                                                                        |
| ENCDG BINARY                                                                 | This value specifies the encoding of the waveform data. To change this value (the other possibility is ASCii), use the <a href="#">WFMOupre:ENCdg</a> command. (This value can also be set using the <a href="#">DATA:ENCdg</a> command, which provides the ability to set the <a href="#">WFMOupre:ENCdg</a> , <a href="#">WFMOupre:BN_Fmt</a> , and <a href="#">WFMOupre:BYT_Or</a> values using a single command.)                        |
| BN_FMT RI                                                                    | This value specifies the binary format, which in this case is RI (signed integer). To change this value (the other possibility is RP or positive integer), use the <a href="#">WFMOupre:BN_Fmt</a> command. Note: this field is not applicable for ASCii encoding.                                                                                                                                                                           |
| BYT_OR MSB                                                                   | This value specifies the byte order for the BINARY encoding, which in this case is MSB (most significant byte first). To change this value to LSB, use the <a href="#">WFMOupre:BYT_Or</a> command. Note: this field is not applicable for ASCii encoding.                                                                                                                                                                                   |
| WFID "Ch1, DC coupling, 100.0mv/div, 4.000us/div, 10000 points, Sample mode" | This quoted string represents information about the source waveform that would be returned by a <a href="#">WFMOupre:WFid?</a> query.                                                                                                                                                                                                                                                                                                        |
| NR_PT 10000                                                                  | This value indicates the number of data points in the waveform record to be transferred using the CURVE? query. (If you would like to determine only this value, use the <a href="#">WFMOupre:NR_Pt?</a> query.) Note: this value is typically equal to the full record length, but you also have the option to transfer only a portion of the record length by using the <a href="#">DATA:START</a> and <a href="#">DATA:STOP</a> commands. |
| PT_FMT Y                                                                     | This value indicates the format of the data points in the waveform record. In this case, the value represents YT format. This is query only – the returned values can be Y for YT format or ENV for envelope format (min/max pairs). (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Fmt?</a> query.)                                                                                                       |
| PT_ORDER LINEAR                                                              | This value is LINEAR or ROW.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| XUNIT "s"                                                                    | This value indicates the units of the x-axis of the waveform record. This is determined by the horizontal settings for the waveform source. Typically, this value is "s", representing seconds. When using the math waveform as a source, the value can be "s" or "Hz". This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XUNit?</a> query.)                                                 |
| XINCR 4.0000E-9                                                              | This value indicates the time, in seconds, or frequency, in hertz, between data points in the waveform record. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XINcr?</a> query.)                                                                                                                                                                                                          |
| XZERO 139.9999E-12                                                           | This value indicates the sub-sample time between the trigger sample (designated by PT_OFF) and the occurrence of the actual trigger in the waveform record. The value is in units of <a href="#">WFMOupre:XUNit</a> . This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XZEro?</a> query.)                                                                                                   |
| PT_OFF 5000                                                                  | This value indicates the data point immediately following the trigger point relative to <a href="#">DATA:START</a> in the waveform record. This is a query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Off?</a> query.)                                                                                                                                                                           |

| WFMOupre? Query results                                              | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WFMOUPRE:BYT_Nr 1                                                    | This value specifies the number of bytes per data point in the waveform data. To change this value automatically, use the <a href="#">WFMOupre:BYT_Nr</a> command. Note that changing this value automatically changes the BIT_Nr value accordingly. (This value can also be set using the <a href="#">DATA:WIDTH</a> command.)                                                                                                                              |
| BIT_Nr 8                                                             | This value specifies the number of bits per data point in the waveform data. To change this value, use the <a href="#">WFMOupre:BIT_Nr</a> command. Note that changing this value automatically changes the BYT_Nr value accordingly.                                                                                                                                                                                                                        |
| ENCDG ASCII                                                          | This value specifies the encoding of the waveform data. To change this value (the other possibility is BINARY), use the <a href="#">WFMOupre:ENCDg</a> command. (This value can also be set using the <a href="#">DATA:ENCDg</a> command, which provides the ability to set the <a href="#">WFMOupre:ENCDg</a> , <a href="#">WFMOupre:BN_Fmt</a> , and <a href="#">WFMOupre:BYT_Or</a> values using a single command.)                                       |
| BN_FMT RI                                                            | This value specifies the binary format, which in this case is RI (signed integer). To change this value (the other possibility is RP or positive integer), use the <a href="#">WFMOupre:BN_Fmt</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                                                           |
| BYT_OR MSB                                                           | This value specifies the byte order for the BINARY encoding, which in this case is MSB (most significant byte first, also known as IBM format). To change this value to LSB, use the <a href="#">WFMOupre:BYT_Or</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                                         |
| WFID "D5, unknown coupling, 100.0us/div, 10000 points, Digital mode" | This quoted string represents information about the source waveform that would be returned by a <a href="#">WFMOupre:WFID?</a> query. It cannot be changed.                                                                                                                                                                                                                                                                                                  |
| NR_PT 25                                                             | This value indicates the number of data points in the waveform record to be transferred using the <a href="#">CURVE?</a> query. (If you would like to determine only this value, use the <a href="#">WFMOupre:NR_Pt?</a> query.) Note: this value is typically equal to the full record length, but you also have the option to transfer only a portion of the record length by using the <a href="#">DATA:STARt</a> and <a href="#">DATA:STOP</a> commands. |
| PT_FMT Y                                                             | This value indicates the format of the data points in the waveform record. In this case, the value represents YT format. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Fmt?</a> query.)                                                                                                                                                                                                               |
| PT_ORDER LINEAR                                                      | This value is always <a href="#">LINEar</a> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| XUNIT "s"                                                            | This value indicates the units of the x-axis of the waveform record. This is determined by the horizontal settings for the waveform source. Typically, this value is "s", representing seconds. When using the math waveform as a source, the value can be "s" or "Hz". This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XUNit?</a> query.)                                                                 |
| XINCR 100.0000E-9                                                    | This value indicates the time, in seconds, or frequency, in hertz, between data points in the waveform record. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XINcr?</a> query.)                                                                                                                                                                                                                          |
| XZERO 155.000E-12                                                    | This value indicates the sub-sample time between the trigger sample (designated by <a href="#">PT_OFF</a> ) and the occurrence of the actual trigger in the waveform record. The value is in units of <a href="#">WFMOupre:XUNit</a> . This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XZEro?</a> query.)                                                                                                  |
| PT_OFF 5000                                                          | This value indicates the data point immediately following the trigger point relative to <a href="#">DATA:STARt</a> in the waveform record. (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Off?</a> query.)                                                                                                                                                                                                                 |

| WFMOUtpre? Query results | Explanation                                                                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YUNIT "State"            | This value indicates the vertical units of data points in the waveform record. This can be any of several string values, depending upon the vertical units of the source waveform – in this case, State. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOUtpre:YUNit?</a> query.) |
| YMULT 1.0000             | This value indicates the multiplying factor to convert the data point values from digitizing levels to the units specified by the <code>WFMOUtpre:YUNit</code> command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOUtpre:YMUIt?</a> query.)                                  |
| YOFF 0.0E+0              | This value indicates the vertical position of the source waveform in digitizing levels. There are 25 digitizing levels per vertical division. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOUtpre:YOFF?</a> query.)                                                             |
| YZERO 0.0E+0             | This value indicates the vertical offset of the source waveform in units specified by the <code>WFMOUtpre:YUNit</code> command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOUtpre:YZero?</a> query.)                                                                          |

### Example 3: Digital with 4 Bytes Per Point and Zoom Off

Goal: Transfer 25 points of Digital data from the instrument to a PC using 4 bytes per point and Zoom off.

| Command                             | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <code>:WFMOUtpre?</code>            | Returns the following values. Each value represents the current settings that a <code>CURVe?</code> query will use to format the data that will be transferred from the instrument to a PC or other device (see next table for explanations):<br><br><code>:WFMOUtpre:BYT_Nr 4;BIT_Nr 32;ENCdg ASCII;BN_FMT RI;BYT_OR MSB;WFID "Digital, unknown coupling, 100.0us/div, 10000 points, Digital mode";NR_PT 25;PT_FMT Y;PT_ORDER LINEAR;XUNIT "s";XINCR 100.0000E-9;XZERO 155.000E-12;PT_OFF 5000;YUNIT "State";YMULT 1.0000;YOFF 0.0E+0;YZERO 0.0E+0</code> |
| <code>:CURVe?</code>                | Returns the following values. Each value represents a data point:<br><br><code>:CURVe<br/>FB386,FB366,FB3E6,FB366,FB3E6,FB32E,FB3A2,FB32E,FB3AA,FB366,FB3EA,FB366,FB3E2,FB36,FB3E6,FB366,FB3E6,FB346,FB3C6,FB346,FB3C6,FB34E,FB3C2,FB34E,FB3CA</code>                                                                                                                                                                                                                                                                                                      |

---

**NOTE.** The returned hexadecimal data values are formatted without leading zeroes. For example, a 4-byte digital value of FB386 should be interpreted as 000FB386.

---

---

**NOTE.** You can also use the *WAVFrm?* query, which concatenates the *WFMOupre?* and *CURVe?* queries.

---

| WFMOupre? Query results                                                   | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WFMOUPRE:BYT_NR 4                                                         | This value specifies the number of bytes per data point in the waveform data. To change this value automatically, use the <a href="#">WFMOupre:BYT_Nr</a> command. Note that changing this value automatically changes the BIT_NR value accordingly. (This value can also be set using the <a href="#">DATA:WIDTH</a> command.)                                                                                                                              |
| BIT_NR 32                                                                 | This value specifies the number of bits per data point in the waveform data. To change this value, use the <a href="#">WFMOupre:BIT_Nr</a> command. Note that changing this value automatically changes the BYT_NR value accordingly.                                                                                                                                                                                                                        |
| ENCDG ASCII                                                               | This value specifies the encoding of the waveform data. To change this value (the other possibility is BINARY), use the <a href="#">WFMOupre:ENCDg</a> command. (This value can also be set using the <a href="#">DATA:ENCDg</a> command, which provides the ability to set the <a href="#">WFMOupre:ENCDg</a> , <a href="#">WFMOupre:BN_Fmt</a> , and <a href="#">WFMOupre:BYT_Or</a> values using a single command.)                                       |
| BN_FMT RI                                                                 | This value specifies the binary format, which in this case is RI (signed integer). To change this value (the other possibility is RP or positive integer), use the <a href="#">WFMOupre:BN_Fmt</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                                                           |
| BYT_OR MSB                                                                | This value specifies the byte order for the BINARY encoding, which in this case is MSB (most significant byte first, also known as IBM format). To change this value to LSB, use the <a href="#">WFMOupre:BYT_Or</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                                         |
| WFID "Digital, unknown coupling, 100.0us/div, 10000 points, Digital mode" | This quoted string represents information about the source waveform that would be returned by a <a href="#">WFMOupre:WFID?</a> query. It cannot be changed.                                                                                                                                                                                                                                                                                                  |
| NR_PT 25                                                                  | This value indicates the number of data points in the waveform record to be transferred using the <a href="#">CURVE?</a> query. (If you would like to determine only this value, use the <a href="#">WFMOupre:NR_Pt?</a> query.) Note: this value is typically equal to the full record length, but you also have the option to transfer only a portion of the record length by using the <a href="#">DATA:START</a> and <a href="#">DATA:STOP</a> commands. |
| PT_FMT Y                                                                  | This value indicates the format of the data points in the waveform record. In this case, the value represents YT format. This is query only – the returned values can be Y for YT format or ENV for envelope format (min/max pairs). (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Fmt?</a> query.)                                                                                                                       |
| PT_ORDER LINEAR                                                           | This value is always LINEar.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| XUNIT "s"                                                                 | This value indicates the units of the x-axis of the waveform record. This is determined by the horizontal settings for the waveform source. For live channels, this value is "s", representing seconds. When using the math waveform as a source, the value can be "s" or "Hz". This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XUNIT?</a> query.)                                                         |

| WFMOupre? Query results | Explanation                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XINCR 100.0000E-9       | This value indicates the time, in seconds, or frequency, in hertz, between data points in the waveform record. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XINcr?</a> query.)                                                                                           |
| XZERO 155.000E-12       | This value indicates the sub-sample time between the trigger sample (designated by PT_OFF) and the occurrence of the actual trigger in the waveform record. The value is in units of WFMOupre:XUNit. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:XZEro?</a> query.)     |
| PT_OFF 5000             | This value indicates the data point immediately following the trigger point relative to DATA:START in the waveform record. (If you would like to determine only this value, use the <a href="#">WFMOupre:PT_Off?</a> query.)                                                                                                  |
| YUNIT "State"           | This value indicates the vertical units of data points in the waveform record. This can be any of several string values, depending upon the vertical units of the source waveform – in this case, State. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YUNit?</a> query.) |
| YMULT 1.0000            | This value indicates the multiplying factor to convert the data point values from digitizing levels to the units specified by the WFMOupre:YUNit command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YMUit?</a> query.)                                                |
| YOFF 0.0E+0             | This value indicates the vertical position of the source waveform in digitizing levels. There are 25 digitizing levels per vertical division. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YOff?</a> query.)                                                             |
| YZERO 0.0E+0            | This value indicates the vertical offset of the source waveform in units specified by the WFMOupre:YUNit command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YZEro?</a> query.)                                                                                        |

## Example 4: Digital with 8 Bytes Per Point and Zoom Off

Goal: Transfer 25 points of Digital data from the instrument to a PC using 8 bytes per point and Zoom off.

| :VERBose 1            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| :WFMOupre?            | Returns the following values. Each value represents the current settings that a CURVe? query will use to format the data that will be transferred from the instrument to a PC or other device (see next table for explanations):<br><br>:WFMOUPRE:BYT_NR 4;BIT_NR 32;ENCDG ASCII;BN_FMT RI;BYT_OR MSB;WFID "Digital, unknown coupling, 100.0us/div, 10000 points, Digital mode";NR_PT 25;PT_FMT Y;PT_ORDER LINEAR;XUNIT "s";XINCR 1.2121E-9;XZERO 155.000E-12;PT_OFF 5000;YUNIT "State";YMULT 1.0000;YOFF 0.0E+0;YZERO 0.0E+0 |
| :CURVe?               | Returns the following values. Each value represents a data point:<br><br>:CURVE<br>FB6E6, FB666, FB6E6, FB666, FB666, FB6E6, FB666, FB6E6, FB666, FB666, FB6E6, FB666, FB6E6, FB666, FB666, FB6E6, FB666, FB666, FB6E6, FB666, FB6E6, FB666                                                                                                                                                                                                                                                                                   |

**NOTE.** The returned hexadecimal data values are formatted without leading zeroes.

**NOTE.** You can also use the *WAVFrm?* query, which concatenates the *WFMOupre?* and *CURVe?* queries.

| WFMOupre? Query results | Explanation                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WFMOUPRE:BYT_NR 4       | This value specifies the number of bytes per data point in the waveform data. To change this value automatically, use the <a href="#">WFMOupre:BYT_Nr</a> command. Note that changing this value automatically changes the BIT_NR value accordingly. (This value can also be set using the <a href="#">DATA:WIDTH</a> command.) |
| BIT_NR 32               | This value specifies the number of bits per data point in the waveform data. To change this value, use the <a href="#">WFMOupre:BIT_Nr</a> command. Note that changing this value automatically changes the BYT_NR value accordingly.                                                                                           |

| WFMOutpre? Query results                                                  | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCDG ASCII                                                               | This value specifies the encoding of the waveform data. To change this value (the other possibility is BINARY), use the <a href="#">WFMOutpre:ENCDg</a> command. (This value can also be set using the <a href="#">DATA:ENCDg</a> command, which provides the ability to set the <a href="#">WFMOutpre:ENCDg</a> , <a href="#">WFMOutpre:BN_Fmt</a> , and <a href="#">WFMOutpre:BYT_Or</a> values using a single command.)                    |
| BN_FMT RI                                                                 | This value specifies the binary format, which in this case is RI (signed integer). To change this value (the other possibility is RP or positive integer), use the <a href="#">WFMOutpre:BN_Fmt</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                                           |
| BYT_OR MSB                                                                | This value specifies the byte order for the BINARY encoding, which in this case is MSB (most significant byte first, also known as IBM format). To change this value to LSB, use the <a href="#">WFMOutpre:BYT_Or</a> command. Note: this field is not applicable for ASCII encoding.                                                                                                                                                         |
| WFID "Digital, unknown coupling, 100.0us/div, 10000 points, Digital mode" | This quoted string represents information about the source waveform that would be returned by a <a href="#">WFMOutpre:WFID?</a> query. It cannot be changed.                                                                                                                                                                                                                                                                                  |
| NR_PT 25                                                                  | This value indicates the number of data points in the waveform record to be transferred using the CURVE? query. (If you would like to determine only this value, use the <a href="#">WFMOutpre:NR_Pt?</a> query.) Note: this value is typically equal to the full record length, but you also have the option to transfer only a portion of the record length by using the <a href="#">DATA:START</a> and <a href="#">DATA:STOP</a> commands. |
| PT_FMT Y                                                                  | This value indicates the format of the data points in the waveform record. In this case, the value represents YT format. This is query only – the returned values can be Y for YT format or ENV for envelope format (min/max pairs). (If you would like to determine only this value, use the <a href="#">WFMOutpre:PT_Fmt?</a> query.)                                                                                                       |
| PT_ORDER LINEAR                                                           | This value is always LINEar.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| XUNIT "s"                                                                 | This value indicates the units of the x-axis of the waveform record. This is determined by the horizontal settings for the waveform source. Typically, this value is "s", representing seconds. When using the math waveform as a source, the value can be "s" or "Hz". This is query only. (If you would like to determine only this value, use the <a href="#">WFMOutpre:XUNit?</a> query.)                                                 |
| XINCR 1.2121E-9                                                           | This value indicates the time, in seconds, or frequency, in hertz, between data points in the waveform record. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOutpre:XINcr?</a> query.)                                                                                                                                                                                                          |
| XZERO 155.000E-12                                                         | This value indicates the sub-sample time between the trigger sample (designated by PT_OFF) and the occurrence of the actual trigger in the waveform record. The value is in units of <a href="#">WFMOutpre:XUNit</a> . This is query only. (If you would like to determine only this value, use the <a href="#">WFMOutpre:XZEro?</a> query.)                                                                                                  |
| PT_OFF 5000                                                               | This value indicates the data point immediately following the trigger point relative to <a href="#">DATA:START</a> in the waveform record. (If you would like to determine only this value, use the <a href="#">WFMOutpre:PT_Off?</a> query.)                                                                                                                                                                                                 |
| YUNIT "State"                                                             | This value indicates the vertical units of data points in the waveform record. This can be any of several string values, depending upon the vertical units of the source waveform – in this case, State. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOutpre:YUNit?</a> query.)                                                                                                                |
| YMULT 1.0000                                                              | This value indicates the multiplying factor to convert the data point values from digitizing levels to the units specified by the <a href="#">WFMOutpre:YUNit</a> command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOutpre:YMUIt?</a> query.)                                                                                                                                              |

| WFMOupre? Query results | Explanation                                                                                                                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YOFF 0.0E+0             | This value indicates the vertical position of the source waveform in digitizing levels. There are 25 digitizing levels per vertical division. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YOFF?</a> query.) |
| YZERO 0.0E+0            | This value indicates the vertical offset of the source waveform in units specified by the <code>WFMOupre:YUNIT</code> command. This is query only. (If you would like to determine only this value, use the <a href="#">WFMOupre:YZero?</a> query.)               |

## Example 6: RF Frequency Domain Waveform

Goal: Transfer 5 points of RF frequency domain data from the instrument to a PC using 8 bytes per point.

**NOTE.** A frequency domain waveform used in data transfer from the instrument to a PC or other device may be one of the four RF frequency domain traces or the Spectrum Math waveform.

| Command                    | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| BYT_NR 8                                                                                                                                                    | This value specifies the number of bytes per data point in the waveform data. This value is fixed for RF frequency domain traces.                                                                                                                                                                                                                                          |
| BIT_NR 64                                                                                                                                                   | This value specifies the number of bits per data point in the waveform data. This value is fixed for RF frequency domain traces.                                                                                                                                                                                                                                           |
| ENCDG ASCII                                                                                                                                                 | This value specifies the encoding of the waveform data. To change this value (the other possibility for RF frequency domain traces is FPBINARY), use the WFMOupre:ENCDg command. This value can also be set using the DATa:ENCDg command.                                                                                                                                  |
| BN_FMT FP                                                                                                                                                   | This value specifies the binary format, which in this case is FP (floating point). This value is fixed for RF frequency domain traces. Note: This field is not applicable for ASCII encoding.                                                                                                                                                                              |
| BYT_OR MSB                                                                                                                                                  | This value specifies the byte order for the BINARY encoding, which in this case is MSB (most significant byte first, also known as IBM format). To change this value to LSB, use the WFMOupre:BYT_Or command. Note: This field is not applicable for ASCII encoding.                                                                                                       |
| WFID "CH1_SV_NORMAl, unknown coupling, 10.00W/div, 200.0MHz/div, 1001 points, Sample mode, Center Freq: 2.400GHz, Span: 2.000GHz, Reference Level: 1.000mW" | This quoted string represents information about the source waveform that would be returned by a WFMOupre:WFId? Query. It cannot be changed.                                                                                                                                                                                                                                |
| NR_PT 21                                                                                                                                                    | This value indicates the number of data points in the waveform record. (If you would like to determine only this value, use the WFMOupre:NR_Pt? query.) Note: This value is typically equal to the full record length of the RF frequency domain trace, but you also have the option to transfer only a portion of the record using the DATs:START and DATa:STOP commands. |
| PT_FMT Y                                                                                                                                                    | This value indicates the format of the data points in the waveform record. In this case, the value represents YF (Amplitude vs. Frequency) format. This is query only. (If you would like to determine only this value, use the WFMOupre:PT_Fmt? query.)                                                                                                                   |
| PT_ORDER LINEAR .                                                                                                                                           | This value is always LINear                                                                                                                                                                                                                                                                                                                                                |
| XUNIT "Hz"                                                                                                                                                  | This value indicates the units of the x-axis of the waveform record. This value is always "Hz" for RF frequency domain traces. This is query only. (If you would like to determine only this value, use the WFMOupre:XUNit? query.)                                                                                                                                        |
| XINCR 2.0000E+6                                                                                                                                             | This value indicates the frequency, in hertz, between data points in the waveform record. This is query only. (If you would like to determine only this value, use the WFMOupre:XINcr? query.)                                                                                                                                                                             |
| XZERO 1.4000E+9                                                                                                                                             | This value indicates the frequency, in hertz, of the first data point in the waveform record. This frequency is relative to the time of the trigger, which is always 0. This XZEro frequency can be negative. This is query only. (If you would like to determine only this value, use the WFMOupre:XZEro? query.)                                                         |
| PT_OFF 0                                                                                                                                                    | This is a query provided only for compatibility with other Tektronix instruments. The returned value is always 0. (If you would like to determine only this value, use the WFMOupre:PT_Off? query.)                                                                                                                                                                        |
| YUNIT "W"                                                                                                                                                   | This value indicates the units of data points in the waveform record. This value depends on the vertical units of the source waveform – in this case, watts. This is query only. (If you would like to determine only this value, use the WFMOupre:YUNit? query.)                                                                                                          |
| YMULT 1.5625E-3                                                                                                                                             | This value indicates the multiplying factor to convert the data point values to the units specified by the:WFMOupre:YUNit command. This is query only. (If you would like to determine only this value, use the WFMOupre:YMUlt? query.)                                                                                                                                    |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YOFF 0.0E+0               | This value indicates the vertical position of the source waveform. This value is unused for RF frequency domain traces and is always 0.                                                                                                                                                                                                                                                                                                            |
| YZERO 0.0E+0              | This value indicates the vertical offset of the source waveform. This value is unused for RF frequency domain traces and is always 0.                                                                                                                                                                                                                                                                                                              |
| DOMAIN FREQUENCY          | This value indicates the domain in which the source waveform is displayed and stored. For RF time domain traces, the domain is Time and waveform transfer information is treated as integer information. For RF frequency domain traces, the domain is Frequency and waveform transfer information is treated as floating point information. This is query only. (If you would like to determine only this value, use the WFMOupre:DOMain? query.) |
| WFMTYPE RF_FD             | This value indicates the type of the source waveform. RF_FD indicates an RF frequency domain trace (frequency domain waveform). This is query only. (If you would like to determine only this value, use the WFMOupre:WFMTYPE? query.)                                                                                                                                                                                                             |
| CENTERFREQUENCY 2.4000E+9 | This value indicates the center frequency, in hertz, of the source waveform. This is query only. (If you would like to determine only this value, use the WFMOupre:CENTERFREQuency? query.)                                                                                                                                                                                                                                                        |
| SPAN 2.0000E+9            | This value indicates the frequency span, in hertz, of the source waveform. This is query only. (If you would like to determine only this value, use the WFMOupre:SPAN? query.)                                                                                                                                                                                                                                                                     |
| REFLEVEL 1.0000E-3        | This value indicates the reference level, in watts, of the source waveform. This is query only. (If you would like to determine only this value, use the WFMOupre:REFLEvel? query.)                                                                                                                                                                                                                                                                |

## Example 7: Baseband IQ Waveform

Goal: Transfer Baseband I and Q data from the instrument to a PC.

**NOTE.** Requires SV-RFVT option.

| Command                      | Comment                                                     |
|------------------------------|-------------------------------------------------------------|
| :DATA:SOURce CH1_BASEBAND_IQ |                                                             |
| :DATA:WIDth 2                | Set data width for every I,Q pair to 2.                     |
| :WFMOupre:ENCdg SRIBinary    | Request data LSB first.                                     |
| :WFMOupre:YMUlt?             | Apply 2*YMUlt scaling to I and Q samples returned by CURVe? |

| Command     | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| :WFMOUtpre? | <p>Returns the following values. Each value represents the current settings that aCURVe? query will use to format the data that will be transferred from the instrument to a PC or other device:</p> <pre data-bbox="634 373 1458 667">:WFMOUtpre:BYT_NR 1;BIT_NR 8;:WFMOUtpre:ENCDG BINARY;BN_FMT RI;:WFMOUtpre:ASC_FMT INTEGER;BYT_OR MSB;:WFMOUtpre:WFID "CH1_SV_BASEBAND_IQ, 5062 points, Center Freq: 1GHz, Span: 312.5MHz";NR_PT 9;:WFMOUtpre:PT_FMT ENV;PT_ORDER LINEAR;:WFMOUtpre:XUNIT "s";XINCR 1.280E-9;:WFMOUtpre:XZERO 815.000E-12;PT_OFF 0;:WFMOUtpre:YUNIT "V";YMULT 8.0000E-3;:WFMOUtpre:YOFF 0.0E+0;YZERO0.0E+0;:WFMOUtpre:DOMAIN TIME;WFMTYPE F_TD;:WFMOUtpre:CENTERFREQUENCY 1.0000E+9;SPAN 312.5000E+6</pre> |
| :CURVe?     | <p>CURVe? will transmit NR_Pt points which are interleaved I and Q pairs. The result can be read from the binary buffer as uint16 to get I and Q pair values in "digitizing levels". Multiply the digitizing level value by 2*YMULT to get absolute I and Q point values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Appendix E: Search and Trigger Command Sequence Examples

The following are some example command sequences that show a variety of different searches and triggers. The commands in these sequences are not order-dependent.

To use these examples, connect channel 1, channel 2, channel 3 and channel 4 to the probe compensation signal located on the right hand side of the front panel.

The search and trigger command group sections contain more information on general search and trigger concepts. ,

## Example 1: Single Threshold Edge Search

Goal: Search the channel 2 waveform and place a mark at each instance where it crosses below a threshold of 1.4 volts.

| Command                                         | Comment                                                                                                                                                            |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *RST;:*OPC?                                     | Resets the instrument and waits for that operation to complete (approximately 1 to 5 seconds depending on the complexity of the previous setup).                   |
| display:waveview1:ch2:state 1                   | Turns the CH2 waveform on.                                                                                                                                         |
| :AUTOset EXECute>:*OPC?                         | Autosets the displayed waveform CH2 and waits for the auto setup to complete.                                                                                      |
| SEARCH:SEARCH1:TRIGger:A:TYPE EDGE              | Specifies that this will be an edge search (a mark will be placed when the source waveform passes through a specified threshold level in the specified direction). |
| SEARCH:SEARCH1:TRIGger:A:EDGE:SOURce CH2        | Specifies the CH2 waveform as the source waveform.                                                                                                                 |
| SEARCH:SEARCH1:TRIGger:A:LOWerthreshold:CH2 1.4 | Specifies 1.4 volts as the threshold level.                                                                                                                        |
| SEARCH:SEARCH1:TRIGger:A:EDGE:SLOpe FALL        | Specifies the falling edge as the direction.                                                                                                                       |
| SEARCH:SEARCH1:STATE 1                          | Turns the search on.                                                                                                                                               |
| SEARCH:SEARCH1:TOTal?                           | Returns 4, indicating that CH2 fell below the 1.4 volt threshold 4 times.                                                                                          |

## Example 2: Single Threshold Edge Trigger

Goal: Trigger on the channel 2 waveform when the waveform crosses below a threshold of 1.4 volts.

| Command                        | Comment                                                                          |
|--------------------------------|----------------------------------------------------------------------------------|
| *RST                           | Resets the instrument. Wait for the reset to complete (approximately 3 seconds). |
| :DISPLAY:WAVEVIEW1:CH2:STATE 1 | Turns the CH2 waveform on.                                                       |

| Command                           | Comment                                                                                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| :TRIGger:A:TYPE EDGE              | Specifies that this will be an edge trigger (trigger will occur when the source waveform passes through a specified threshold level in the specified direction). |
| :TRIGger:A:EDGE:SOURce CH2        | Specifies the CH2 waveform as the source waveform.                                                                                                               |
| :TRIGger:A:LOWerthreshold:CH2 1.4 | Specifies 1.4 volts as the threshold level.                                                                                                                      |
| :TRIGger:A:EDGE:SLOpe FALL        | Specifies as falling edge as the direction.                                                                                                                      |
| :TRIGger:STATE?                   | Should return TRIGGER, not AUTO.                                                                                                                                 |

### Example 3: Dual Threshold Runt Search

Goal: Search the channel 3 waveform for negative runt pulses and place a mark at each instance when the waveform drops below an upper threshold of 1.4 volts, but does not cross a lower threshold of -2 volts before re-crossing the upper threshold. The pulse width must be less than 600 microseconds.

| Command                                          | Comment                                                                                                                                                                               |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *RST                                             | Resets the instrument. Wait for the reset to complete (approximately 3 seconds).                                                                                                      |
| :DISPLAY:WAVEVIEW1:CH3:STATE 1                   | Turns the CH3 waveform on.                                                                                                                                                            |
| :AUTOset EXECute                                 | Autosets the displayed waveform CH3. Wait for the autoset to complete (approximately 3 seconds).                                                                                      |
| SEARCH:SEARCH1:TRIGger:A:TYPE RUNT               | Specifies that this will be a runt search (a mark will be placed on a pulse amplitude that crosses one threshold but fails to cross a second threshold before re-crossing the first). |
| SEARCH:SEARCH1:TRIGger:A:EDGE:SOURce CH3         | Specifies to use channel 3 as the source waveform.                                                                                                                                    |
| SEARCH:SEARCH1:TRIGger:A:LOWerthreshold:CH3 -2   | Specifies to use -2 volts as the lower threshold.                                                                                                                                     |
| SEARCH:SEARCH1:TRIGger:A:UPPerthreshold: CH3 1.4 | Specifies to use 1.4 volts as the upper threshold.                                                                                                                                    |
| SEARCH:SEARCH1:TRIGger:A:RUNT:POLarity NEGative  | Specifies to search for when the runt polarity is negative.                                                                                                                           |
| SEARCH:SEARCH1:TRIGger:A:RUNT:WIDth 600E-6       | Specifies a pulse width of 600E-6 seconds.                                                                                                                                            |
| SEARCH:SEARCH1:TRIGger:A:RUNT:WHEn LESSthan      | Specifies to search for when the pulse width is less than 600E-6 seconds.                                                                                                             |
| SEARCH:SEARCH1:STATE 1                           | Turns the search on.                                                                                                                                                                  |
| SEARCH:SEARCH1:TOTal?                            | Returns 3, indicating that 3 total negative runt pulses were less than 600E-6 seconds wide                                                                                            |

**NOTE.** You could use a similar command sequence with a transition type search.

## Example 4: Single Threshold Logic Search on Three Waveforms

Goal: Search the channel 1, 2 and 3 waveforms and place a mark at each instance when either channel 1 is above 1.4 volts, channel 2 is above 1.5 volts, or channel 3 is above 1.3 volts.

| Command                                          | Comment                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *RST                                             | Resets the instrument. Wait for the reset to complete (approximately 3 seconds).                                                                                                                                                                                                                      |
| :DISPLAY:WAVEVIEW1:CH1:STATE 1                   | Turns the CH1 waveform on.                                                                                                                                                                                                                                                                            |
| :DISPLAY:WAVEVIEW1:CH2:STATE 1                   | Turns the CH2 waveform on.                                                                                                                                                                                                                                                                            |
| :DISPLAY:WAVEVIEW1:CH3:STATE 1                   | Turns the CH3 waveform on.                                                                                                                                                                                                                                                                            |
| :AUTOset EXECute                                 | Autosets the displayed waveforms CH1, CH2 and CH3. Wait for the autose to complete (approximately 3 seconds).                                                                                                                                                                                         |
| SEARCH:SEARCH1:TRIGger:A:TYPE LOGic              | Specifies that this will be a logic search (a mark will be placed when all channels transition to the specified state).                                                                                                                                                                               |
| SEARCH:SEARCH1:TRIGger:A:LOGic:INPut:CH1 HIGH    | Specifies the Boolean logic criteria for channel 1; in this case, high.                                                                                                                                                                                                                               |
| SEARCH:SEARCH1:TRIGger:A:LOGic:INPut:CH2 HIGH    | Specifies the Boolean logic criteria for channel 2; in this case, high.                                                                                                                                                                                                                               |
| SEARCH:SEARCH1:TRIGger:A:LOGic:INPut:CH3 HIGH    | Specifies the Boolean logic criteria for channel 3; in this case, high.                                                                                                                                                                                                                               |
| SEARCH:SEARCH1:TRIGger:A:LOGic:THReshold:CH1 1.4 | Specifies to use 1.4 volts as the threshold for CH1.                                                                                                                                                                                                                                                  |
| SEARCH:SEARCH1:TRIGger:A:LOGic:THReshold:CH2 1.5 | Specifies to use 1.5 volts as the threshold for CH2.                                                                                                                                                                                                                                                  |
| SEARCH:SEARCH1:TRIGger:A:LOGic:THReshold:CH3 1.3 | Specifies to use 1.3 volts as the threshold for CH3.                                                                                                                                                                                                                                                  |
| SEARCH:SEARCH1:TRIGger:A:LOGic:PATtern:WHEn TRUE | Specifies the condition for generating a logic pattern search; in this case, true.                                                                                                                                                                                                                    |
| SEARCH:SEARCH1:TRIGger:A:LOGic:FUNCTION OR       | Specifies the logic operator for the logic search; in this case, OR.                                                                                                                                                                                                                                  |
| SEARCH:SEARCH1:STATE 1                           | Turns the search on.                                                                                                                                                                                                                                                                                  |
| SEARCH:SEARCH1:TOTal?                            | Returns 3 or 4, indicating 3 or 4 times when one of channels 1, 2 or 3 became high.<br><br>Note: Depending upon the number of transitions displayed, you may get 3 or 4 search marks for this example. If you get 3 search marks, try adjusting the horizontal position until you see 4 search marks. |

---

# Glossary

## **ASCII**

Acronym for the American Standard Code for Information Interchange. Controllers transmit commands to the instrument using ASCII character encoding.

## **Address**

A 7-bit code that identifies an instrument on the communication bus. The digitizing instrument must have a unique address for the controller to recognize and transmit commands to it.

## **Backus-Naur Form (BNF)**

A standard notation system for command syntax diagrams. The syntax diagrams in this manual use BNF notation.

## **Controller**

A computer or other device that sends commands to and accepts responses from the digitizing instrument.

## **EOI**

A mnemonic referring to the control line End or Identify. One of the two possible end-of-message terminators.

## **EOM**

A generic acronym referring to the end-of-message terminator. The end-of-message terminator can be either an EOI or the ASCII code for line feed (LF).

## **Equivalent-Time sampling (ET)**

A sampling mode in which the instrument acquires signals over many repetitions of the event. This instrument uses a type of equivalent time sampling called random equivalent time sampling. It utilizes an internal clock that runs asynchronously with respect to the input signal and the signal trigger. The instrument takes samples continuously, independent of the trigger position, and displays them based on the time difference between the sample and the trigger. Although the samples are taken sequentially in time, they are random with respect to the trigger.

## **Real-Time sampling**

A sampling mode where the instrument samples fast enough to completely fill a waveform record from a single trigger event. Use real-time sampling to capture single-shot or transient events.

## **IEEE**

An acronym for the Institute for Electrical and Electronic Engineers.

## **Serial poll**

A device on the bus can request service from the Controller by asserting the SRQ line. When a controller acknowledges the SRQ, it serial polls each device on the bus to determine which device on the bus requested service. Any device requesting service returns a status byte indicating it needs to be serviced and then

unasserts the SRQ line. Devices not requiring service return a status byte that indicates they do not need servicing.

**TEKSecure**

A Tektronix custom command that initializes both waveform and setup memories. This overwrites any previously stored data.
