Introduction

Agilent U2300A Series USB modular multifunction data acquisition (DAQ) devices are a high performance PC data acquisition solution. The U2300A Series DAQ devices consist of two families—basic multifunction DAQ and high density multifunction DAQ. The basic multifunction DAQ family comes in four models while the high density multifunction DAQ family is made up of three models.

The U2300A Series DAQ devices applications extend across industrial and education environments. The DAQ device is well suited for research and development, manufacturing and design validation engineers, who require measurement devices with fast sampling rate.

High Sampling Rate

The U2300A Series DAQ devices have sampling rate of up to 3 MSa/s for a single channel. When multiple channels are configured, it can sample data up to 1 MSa/s. This fast sampling capability allows users to perform intermittent detection easily. This also makes it ideal when dealing with high density analog input/output signals, especially with different input ranges and sampling requirements.

Flexible Standalone or Modular Capability

The U2300A Series DAQ devices are uniquely designed for the flexibility of functioning as a standalone or modular unit. When used with the U2781A modular instrument chassis, the number of channels can reach up to 384 channels.

Ease of Use

The U2300A Series DAQ devices are equipped with Hi-Speed USB 2.0 interface for easy setup, plug-and-play, and hot swappable connectivity. Its ease-of-use makes it ideal for the education environment. Simplifying this further is the Agilent Measurement Manager software that offers a simple interface for quick setup, configuration and measurement control.

Flexible System and Control Options

Polling and continuous mode

The U2300A Series DAQ devices provide two modes, the polling mode and the continuous mode. The continuous mode has the ability to acquire data continuously once the trigger signal is received.

Trigger sources

U2300 Series offers immediate trigger (none), analog/external digital trigger, System Synchronous Interface (SSI)/star trigger and master/slave trigger sources. All these trigger options give you the capability to configure trigger sources during A/D and D/A operations. Master/slave trigger and SSI/star trigger are recommended when USB modules are slotted into the Agilent U2781A USB modular instrument chassis.

Predefined function generator

The two analog output channels offered does not only provide DC voltage but also are capable of generating common and predefined waveforms such as sinusoid wave, square wave, triangle wave, sawtooth wave and noise wave.

Arbitrary Waveform

U2300A Series supports arbitrary waveform, which allows user to generate arbitrary waveform via Agilent Measurement Manager application software or SCPI command.

Burst mode

Burst mode is an enhancement feature of U2300 Series DAQ that enable the DAQ to simulate in simultaneous mode for analog input acquisition. This enable users to perform sampling measurement up to the highest speed of the DAQ capability.

Compatible with wide range of Application Development Environments

The Agilent U2300A DAQ devices are compatible with a wide range of Application Development Environments. This minimizes all the time taken by R&D and manufacturing engineers to use the devices in different software environments as they can program directly using SCPI commands.

Listed below are the popular development environments and tools that the DAQ device is compatible with:

- Agilent VEE and Agilent T&M Toolkit
- Microsoft Visual Studio.NET, C/C++ and Visual Basic 6
- LabVIEW
- MATLAB® (Agilent U2300A Adaptor is available at www.agilent.com/find/U2300A)

Unipolar Range (V)	Offset Error (mV) ^[1]	Gain Error (mV)	Accuracy (% of reading + offset error) ^[2]
10	2.5	4.0	0.04% + 2.5 mV
Bipolar Range (V)	Offset Error (mV) ^[1]	Gain Error (mV)	Accuracy (% of reading + offset error) ^[2]
10	1.5	4.0	0.04% + 1.5 mV

1. The above specifications are typical for 23°C.
2. Specifications are for 20 minutes warm-up and self calibration.

[1] Offset error is measured at 0 V.

[2] Accuracy = +/- [% of |Gain Error/Output value| + offset voltage]
